Function List Component Descriptions

The Function List includes the following components:

Function ID # (Normative)

This is the unique identifier of a function in the Function List (e.g. CP.1.1) and should be used to uniquely identify the function when referencing functions. The Function ID also serves to identify the section within which the function exists (CP = Care Provision Section) and the hierarchy or relationship between functions (CP.1.1 is a sibling to CP.1.2, parent of CP.1.1.1 and child of CP.1). In many cases the parent is fully expressed by the children.

Function Type (Reference)

Indication of the line item as being a header (H) or function (F) or conformance criteria.

Header/Function Name (Normative)

This is the name of the Function and whilst expected to be unique within the Function List; it is not recommended to be used to identify the function without being accompanied by the Function ID. Example: Manage Medication List

Function Statement (Normative)

This is a brief statement of the purpose of this function. Whist not restricted to the use of structured language that is used in the Conformance Criteria (see below); the Statement should clearly identify the purpose and scope of the function.

Example: Create and maintain patient-specific medication lists.

Description (Reference)

This is a more detailed description of the function, including examples if needed. Example: Medication lists are managed over time, whether over the course of a visit or stay, or the lifetime of a patient. All pertinent dates, including medication start, modification, and end dates are stored. The entire medication history for any medication, including alternative supplements and herbal medications, is viewable. Medication lists are not limited to medication orders recorded by providers, but may include, for example, pharmacy dispense/supply records, patient-reported medications and additional information such as age specific dosage.

Conformance Criteria (Normative)

Each function in the Function List includes one or more Conformance Criteria. A Conformance Criteria, which exists as normative language in this standard, defines the requirements for conforming to the function. The language used to express a conformance criterion is highly structured with standardized components with set meanings. The structured language used to define conformance clauses in the Function List are defined in the Glossary (Chapter 4).

R1.1 Reference (Reference)

Reference to the previous version of the Functional Model is included to support transition from one version to the next. The first 2 digits indicate the source document; FM = Functional Model, LM = Lifecycle Model. The remainder of the reference is to the function and, if applicable, conformance criteria.

Change Indicator

The change indicator shows the change from previous versions. This will be valued as follows:

C - Changed D - Deleted N - New NC - No Change

Row#

A unique number for the row within the section.

1. Overarching Section

Section Overview

The Overarching Section contains Conformance Criteria that apply to all EHR Systems and consequently must be included in all EHR-S FM compliant profiles. These criteria are grouped under a single Function. All functions within the Overarching Section have an identifier starting with "OV".

| Section/Id#: Type: | Header/Function Name Conformance Criteria | Reference | Chg Ind | Row# |
|-----------------------|--|--------------|-----------------|------|
| OV.1 Function | Overarching Criteria | | NC | 1 |
| State | ement: Overarching criteria are those that apply to all EHR Systems. | | | |
| | cription: The Overarching Section contains Conformance Criteria that apply to all EHR Systems and EHR-S FM compliant profiles. These criteria are grouped under a single Function. | d consequent | y must be inclu | uded |
| 1. | The system SHALL conform to function CP.9.1 (Produce a Summary Record of Care). | | NC | 2 |
| 2. | The system SHALL conform to function CPS.9.3 (Health Record Output). | | NC | 3 |
| 3. | The system SHALL conform to function CPS.9.4 (Standard Report Generation). | | NC | 4 |
| 4. | The system SHALL conform to function RI.1.1 (Record Lifecycle) and all child functions. | | NC | 5 |
| 5. | The system SHALL conform to function RI.1.2 (Record Lifespan) and all child functions. | | NC | 6 |
| 6. | The system SHALL conform to function RI.2 (Record Synchronization). | | NC | 7 |
| 7. | The system SHALL conform to function RI.3 (Record Archive and Restore). | | NC | 8 |
| 8. | The system SHALL conform to function TI.1.1 (Entity Authentication). | | NC | 9 |
| 9. | The system SHALL conform to function TI.1.2 (Entity Authorization) . | | NC | 10 |
| 10. | The system SHALL conform to function TI.1.3 (Entity Access Control). | | NC | 11 |
| | The system SHALL conform to function TI.1.4 (Patient Access Management). | | NC | 12 |
| | The system SHALL conform to function TI.1.5 (Non-Repudiation). | | NC | 13 |
| | IF the system transmits data to or receives data from a system outside of a secure network, THEN the system SHALL conform to function <u>TI.1.6</u> (Secure Data Exchange), to ensure that the data are protected. | | NC | 14 |
| 14. | IF the system transmits data to or receives data from a system outside of a secure network, THEN the system SHALL conform to function <u>TI.1.7</u> (Secure Data Routing), to ensure that the exchange occurs only among authorized senders and receivers. | | NC | 15 |
| 15. | The system SHALL conform to function TI.1.8 (Patient Privacy and Confidentiality). | | NC | 16 |
| | The system SHALL conform to function TI.2 (Audit) and all child functions. | | NC | 17 |
| | The system SHOULD conform to function TI.3 (Registry and Directory Services). | | NC | 18 |
| | The system SHALL conform to function TI.4 (Standard Terminology and Terminology Services). | | NC | 19 |
| | IF the system manages data for which standard terminologies have been established, THEN the system SHALL conform to function TI.4.1 (Standard Terminologies and Terminology Models) to support semantic interoperability. | | NC | 20 |
| 20. | IF the system manages data for which standard terminologies have been established, THEN the system SHALL conform to function TI.4.2 (Maintenance and Versioning of Standard Terminologies) to preserve the semantics of coded data over time. | | NC | 21 |
| 21. | IF terminology mapping is implemented within the system, THEN the system SHALL conform to function TI.4.3 (Terminology Mapping). | | NC | 22 |
| 22. | IF the system receives or transmits data for which jurisdictionally established interchange standards exist, THEN the system SHALL conform to function TI.5.1 (Application and Structured-Document Interchange Standards) and all child functions to support interoperability. | | NC | 23 |
| 23. | IF the system receives and transmits data for which generally accepted interchange standards have been established, THEN the system SHALL conform to function T1.5.2 (Interchange Standards Versioning and Maintenance), to accommodate the inevitable evolution of interchange standards. | | NC | 24 |
| 24. | The system SHOULD conform to function TI.5.3 (Standards-based Application Integration). | | NC | 25 |
| | IF the system receives and transmits data with other systems outside itself, THEN the system SHALL conform to function TI.5.4 (Interchange Agreements), to define how the sender and receiver will exchange data. | | NC | 26 |
| 26. | The system SHOULD conform to function TI.6 (Business Rules Management). | | NC | 27 |
| | The system SHOULD conform to function TI.7 (Workflow Management). | | NC | 28 |
| | The system SHALL conform to function TI.8 (Database Backup and Recovery). | | NC | 29 |
| | The system SHALL conform to function CPS.10 (Manage User Help). | | NC | 31 |
| | The system SHALL conform to function TI.9 (System Management Operations and Performance). | | NC | 30 |

2. Care Provision Section

Section Overview

The Care Provision Section contains those functions and supporting Conformance Criteria that are required to provide direct care to a specific patient and enable hands-on delivery of healthcare. The functions are general and are not limited to a specific care setting and may be applied as part of an Electronic Health Record supporting healthcare offices, clinics, hospitals and specialty care centers. The functions in this section are organized in general flow of an encounter; however, it is recognized that encounter flow varies considerably in different care settings and scopes of practice. All functions within the Care Provision Section have an identifier starting with "CP".

| Section/ld#: Type: | Header/Function Name Conformance Criteria | Reference | Chg Ind | Row# |
|-----------------------|---|-----------|---------|------|
| CP.1 Header | Manage Clinical History | DC.1.4 | NC | 32 |

Statement: Manage the patient's clinical history lists used to present summary or detailed information on patient health history.

Description: Patient Clinical History lists are used to present succinct "snapshots" of critical health information including patient history; allergy, intolerance and adverse reactions; medications; problems; strengths; immunizations; medical equipment/devices; and patient and family preferences.

| CP.1.1 | Manage Patient History | DC 1.2 | NC | 22 |
|----------|-----------------------------|--------|-----|----|
| Function | ivialitage Falletit History | DC.1.2 | INC | 33 |

Statement: Manage medical, procedural/surgical, mental health, substance use, social and family history. This includes pertinent positive and negative histories, patient-reported or externally available patient clinical history.

Description: The history of the current illness and patient historical data related to previous medical diagnoses, surgeries and other procedures performed on the patient, clinicians involved in procedures or in past consultations, and relevant health conditions of family members is captured through such methods as patient reporting (e.g., interview, medical alert band) or electronic or non-electronic historical data. This data may take the form of a pertinent positive such as "The patient/family member has had..." or a pertinent negative such as "The patient/family member has not had...". When first seen by a health care provider, patients typically bring with them clinical information from past encounters. This and similar information may supplement locally captured documentation and notes wherever appropriate. Information regarding the patient's living situations may be an important means for a provider to uniquely identify a patient or to identify illnesses that may occur within a given proximity. Information regarding past or present living situations or environmental factors related to the patient or the fetal death may include a description of the father's type of occupation and occupational demographic information (such as the name and location of the employment). For example, it may be important for the clinician to know that the patient works in an occupation where lead exposure is common. It may also be important for the clinician to know that the patient lives in a household where asbestos routinely appears on clothing.

| 1. | The system SHALL provide the ability to manage current patient history including pertinent positive and negative elements (e.g., diagnosis or ruled out diagnosis), and information on clinicians involved. | DC.1.2#1 | NC | 34 |
|-----|--|----------|----|----|
| 2. | The system SHALL provide the ability to manage the identity of clinicians involved in patient history elements according to scope of practice, organizational policy, and/or jurisdictional law. | DC.1.2#1 | NC | 35 |
| 3. | The system SHOULD conform to function CPS.2.1 (Support externally-sourced Clinical Documents) to capture, store and render previous external patient histories. | DC.1.2#2 | NC | 36 |
| 4. | The system SHOULD conform to function <u>CPS.2.2</u> (Support externally-sourced Clinical Data) to capture, store and render previous external patient histories. | | NC | 37 |
| 5. | The system SHALL provide the ability to capture family history. | | NC | 38 |
| 6. | The system SHALL provide the ability to capture social history. | | NC | 39 |
| 7. | The system SHALL provide the ability to capture as part of the patient history the patient's relationships (e.g., genealogic, living situation, other). | DC.1.2#3 | NC | 40 |
| 8. | The system SHALL provide the ability to capture structured data in the patient history (e.g., administrative, social, mental health, geographic location, and/or financial statuses, poverty, orphan, disability, incarceration, incompetence, or remote geographic location). | | NC | 41 |
| 9. | The system SHALL maintain and render documentation made in a non-linear as well as linear temporal and non-temporal sequence. | | NC | 42 |
| 10. | The system SHOULD provide the ability to present multiple levels of data (log view versus readable view) versus not display at all. | | NC | 43 |
| 11. | The system SHOULD provide the ability to capture patient history adhering to a standards-based form or template according to scope of practice, organizational policy, and/or jurisdictional law. | | NC | 44 |
| 12. | The system SHOULD provide the ability to capture an indication of the patient's receipt of social subsidies. | | NC | 45 |
| 13. | The system SHOULD provide the ability to capture Investigational Product (e.g., medication, device, immunization) exposure information including Start Date/time, End Date/Time, Dose Amount, Dose Unit, Study Treatment Name, Route, Formulation as discrete elements. | | NC | 46 |
| 14. | The system SHOULD provide the ability to manage information regarding past or present living situations or environmental factors related to the patient (e.g., war, famine, poverty, political | | NC | 0 |

| Section/Id#: Type: | Header/Function Name Conformance Criteria | Reference | Chg Ind | Row# |
|-----------------------|--|--------------------------|---------|------|
| | situation, or proximity to dangerous chemicals) according to scope of policy, and/or jurisdictional law. | ractice, organizational | | |
| CP.1.2 Function | Manage Allergy, Intolerance and Adverse | e Reaction List DC.1.4.1 | NC | 47 |

Statement: Manage patient-specific allergy, intolerance and adverse reaction lists.

Description: Allergens to substances, (including immunizations), are identified and the list of allergies is captured and maintained over time. Information regarding allergies may be coded or free text; coded information is preferred (where possible). In this function the term "allergy" is used to refer to allergies, intolerances, adverse reactions and sensitivities. All pertinent dates, including patient-reported events, are stored and the description of the patient allergy and adverse reaction is modifiable over time. The entire allergy history, including reaction, for any allergen is viewable. The list(s) includes all reactions including those that are classifiable as a true allergy, intolerance, side effect or other adverse reaction to drug, food or environmental triggers. Notations indicating whether item is patient reported, and/or provider verified are maintained. The term 'true allergy' is defined by the US National Library of Medicine as: an allergy that is caused by a series of chemical steps in the body that produce the allergic reaction. The allergy information that should be captured may vary according to scope of practice, organizational policy, and/or jurisdictional law. For example, the documentation requirements regarding an allergic reaction to a substance that is reportable may require a higher level of data capture.

| . 09 | ag a and g.o. reaction to a capital to reportable may require a migner to tell or adia capital | | | |
|------|---|-------------|----|----|
| 1. | The system SHALL provide the ability to manage allergy, intolerance, and adverse reaction to drug, food, medical products (e.g., vaccines, biologics, devices, chemicals) or environmental triggers as unique, discrete entries. | DC.1.4.1#1 | NC | 48 |
| 2. | The system SHOULD provide the ability to manage the reason for the capture, update or removal of the allergy, no-longer-allergic, intolerance, sensitivity, and adverse reaction. | DC.1.4.1#2 | NC | 49 |
| 3. | The system SHALL provide the ability to manage the reaction type as discrete data. | DC.1.4.1#3 | NC | 50 |
| 4. | The system SHOULD provide the ability to manage the reaction type as coded data. | | NC | 51 |
| 5. | The system SHALL provide the ability to manage the severity of an allergic or adverse reaction as discrete data. | DC.1.4.1#4 | NC | 52 |
| 6. | The system SHALL provide the ability to manage a report of No Known Allergies (NKA) for the patient. | DC.1.4.1#5 | NC | 53 |
| 7. | The system SHALL provide the ability to manage a report of No Known Food Allergies (NKFA) for the patient. | DC.1.4.1#6 | NC | 54 |
| 8. | The system SHOULD provide the ability to manage the source of allergy, intolerance, and adverse reaction information. | DC.1.4.1#7 | NC | 55 |
| 9. | The system SHALL provide the ability to tag as deactivated an allergy, intolerance or adverse reaction. | DC.1.4.1#8 | NC | 56 |
| 10. | The system SHALL provide the ability to capture as discrete data the reason for deactivation of an allergy, intolerance or adverse reaction. | DC.1.4.1#9 | NC | 57 |
| 11. | The system SHALL provide the ability to render an allergy, intolerance, and adverse reaction that has been deactivated. | DC.1.4.1#10 | NC | 58 |
| 12. | The system SHOULD provide the ability to render the list of allergies, intolerances and adverse reactions in a user-defined sort order. | DC.1.4.1#11 | NC | 59 |
| 13. | The system MAY restrict the ability to render the list of allergies, intolerances and adverse reactions in a user-defined sort order (e.g., to reduce the confusion when the same list is sorted by severity one day and then by date-of-onset the next day). | | NC | 60 |
| 14. | The system SHALL provide the ability to tag that the list of allergies, intolerances and adverse reactions has been reviewed. | DC.1.4.1#12 | NC | 6′ |
| 15. | They system SHALL provide the ability to capture and render the date on which allergy information was entered. | DC.1.4.1#13 | NC | 62 |
| 16. | The system SHOULD provide the ability to capture and render the approximate date of the allergy occurrence. | DC.1.4.1#14 | NC | 6: |
| 17. | The system SHOULD provide the ability to manage allergy-information as standards-based coded data. | | NC | 64 |
| 18. | The system SHOULD provide the ability to capture and maintain allergy information prior to completion of the medication order. | | NC | 6 |
| 19. | The system SHOULD provide the ability to capture and render that the allergies are "Unknown" or "Unable to Assess Allergies". | | NC | 66 |
| 20. | The system SHOULD provide the ability to capture the reason for "Unknown" or "Unable to Assess Allergies" documentation. | | NC | 67 |
| 21. | The system SHOULD provide the ability to tag records and render to providers that the allergies are "Unknown" or "Unable to Assess Allergies" and need to be updated. | | NC | 68 |
| 22. | The system SHOULD provide the ability to capture free text allergies and render them in a manner that distinguishes them from coded allergy entries. | | NC | 69 |
| 23. | The system SHOULD tag and render an indicator that interaction checking (e.g., drug-allergy checking) will not occur against free text allergies. | | NC | 70 |
| 24. | The system SHOULD provide the ability to render historical allergy information. | | NC | 7′ |
| 25. | The system MAY provide the ability to link an allergy, intolerance, or adverse reaction with diagnostic results (e.g., laboratory or allergy test result). | | NC | 72 |

| Section/Id#: Type: | Header/Function Name Conformance Criteria | Reference | Chg Ind | Row# |
|-----------------------|--|--------------|---------|------|
| 26. | The system SHOULD conform to function CPS.4.2.1 (Support for Medication Interaction and Allergy Checking) to render any potential interactions when capturing or maintaining allergies, intolerances or adverse reactions. | | NC | 73 |
| 27. | The system SHOULD capture an indicator that a provider was presented with, and acknowledged, a drug interaction notification. | DC.2.3.1.1#3 | NC | 74 |
| CP.1.3 Function | Manage Medication List | DC.1.4.2 | NC | 75 |
| Stat | ement: Create and maintain patient-specific medication lists. | | | |

Description: Medication lists are managed over time, whether over the course of a visit or stay, or the lifetime of a patient. The entire medication history for any medication including, over-the-counter products, alternative supplements and herbal medications, is viewable. Medication lists are not limited to provider orders/prescriptions but may also include, for example, pharmacy dispensed medications without prescription, over the counter medications and patient-reported medications, etc. All pertinent dates, including medication start,

| 1. | The system SHALL provide the ability to manage a patient-specific medication list based on current | DC.1.4.2#1 | NC | 7 |
|-----|---|-------------|-----|---|
| | medication orders or prescriptions. | 50.1.4.2#1 | INC | , |
| 2. | The system SHALL provide the ability to manage as discrete data the details of the medication information including name of the medication ordered, medication identifier (e.g., RxNORM), prescriber, ordering date, SIG (e.g., dose amount and quantity, timing, duration and route, and/ or site of administration), quantity, formulation and ancillary instructions according to scope of practice, organizational policy, and/or jurisdictional law. | DC.1.4.2#3 | NC | 7 |
| 3. | The system SHALL provide the ability to manage as discrete data the Study Treatment Name for any captured Investigational Product Exposures according to scope of practice, organizational policy, and/or jurisdictional law. | | NC | 7 |
| 4. | The system SHOULD provide the ability to capture all dates associated with medications including start, end, and discontinuation dates according to scope of practice, organizational policy, and/or jurisdictional law. | DC.1.4.2#4 | NC | 7 |
| 5. | The system SHALL provide the ability to capture and maintain current and historical patient-specific medications in the Medication List. | DC.1.4.2#5 | NC | 8 |
| 6. | The system SHALL provide the ability to capture non-prescription medications including over the counter and complementary medications such as vitamins, herbs and supplements. | DC.1.4.2#6 | NC | 8 |
| 7. | The system SHALL provide the ability to render the medication history associated with a patient. | DC.1.4.2#8 | NC | 8 |
| 8. | The system SHALL provide the ability to tag a medication as "erroneously captured". | DC.1.4.2#10 | NC | 8 |
| 9. | The system SHALL provide the ability to render a Medication List excluding medications that have been tagged as "erroneously captured". | | NC | 8 |
| 10. | The system SHALL render an indicator that a medication is tagged as "erroneously captured" when that medication is rendered in a Medication List. | | NC | 8 |
| 11. | The system SHALL provide the ability to render a current medication list for patient use. | DC.1.4.2#11 | NC | 3 |
| 12. | The system SHOULD provide the ability to capture and render information regarding the filling of prescriptions - prior to the prescription being dispensed. | DC.1.4.2#12 | NC | 8 |
| 13. | The system SHOULD provide the ability to capture and render a notification that a prescription cannot be filled. | | NC | 8 |
| 14. | The system SHOULD provide the ability to capture and render a notification that a prescription cannot be dispensed. | | NC | 8 |
| 15. | The system SHOULD provide the ability to receive current medications and a medication history from an external source (e.g., a plan, payer or pharmacy). | | NC | 9 |
| 16. | The system SHOULD provide the ability to tag that a medication history is unavailable or incomplete. | | NC | ę |
| 17. | The system SHALL provide the ability to capture a description of the medication and a reason for the medication when the medication name is unknown (e.g., if patient has received medication from external source and does not have the name, and/or the name is not in the system formulary). | | NC | 9 |
| 18. | The system SHALL provide the ability to tag and render, on the active medication list, active medications that the patient brings from home to take while hospitalized, which the Pharmacy may not dispense, according to scope of practice, and/or organizational policy. | | NC | 9 |
| 19. | The system SHOULD provide the ability to maintain the medication list with changes from pharmacist verification including pharmacist, date, and time. | | NC | ę |
| 20. | The system SHOULD provide the ability to manage the reason or indication for the medication when recording historical medications or medications from external sources (e.g., from home or other provider). | | NC | 9 |
| 21. | The system SHOULD provide the ability to update a medication order directly from the medication list. | | NC | (|
| 22. | The system SHALL conform to function <u>CPS.4.2.1</u> (Support for Medication Interaction and Allergy Checking) to render any potential interactions when capturing or maintaining medications. | | NC | (|
| 23. | The system SHALL provide the ability to capture free text medications and render them in a manner that distinguishes them from coded medication entries. | | NC | 9 |

| CP.1.4 Function | | Manage Problem List | DC.1.4.3 | NC | 108 |

Statement: Create and maintain patient-specific problem lists.

Description: A problem list may include, but is not limited to chronic conditions, diagnoses, or symptoms, injury/poisoning (both intentional and unintentional), adverse effects of medical care (e.g., drugs, surgical), functional limitations, visit or stay-specific conditions, diagnoses, or symptoms. Problem lists are managed over time, whether over the course of a visit or stay or the life of a patient, allowing documentation of historical information and tracking the changing character of problem(s) and their priority. The source (e.g., the provider, the system id, or the patient) of the updates should be documented. All pertinent dates are stored, including date noted or diagnosed, dates of any changes in problem specification or prioritization, and date of resolution. This might include time stamps, where useful and appropriate. The entire problem history for any problem in the list is viewable.

| 1. | The system SHALL provide the ability to manage, as discrete data, all active problems associated with a patient. | DC.1.4.3#1 | NC | 109 |
|-----|--|-------------|----|-----|
| 2. | The system SHALL capture, maintain and render a history of all problems associated with a patient. | DC.1.4.3#2 | NC | 110 |
| 3. | The system SHALL provide the ability to manage the status of each problem (e.g., active, inactive, resolved). | | NC | 111 |
| 4. | The system SHALL provide the ability to manage relevant dates including the onset date and date(s) of problem status change (e.g., inactivation or resolution date). | DC.1.4.3#3 | NC | 112 |
| 5. | The system SHALL provide the ability to manage information about the chronicity duration (e.g., chronic, acute/self-limiting) of a problem. | DC.1.4.3#4 | NC | 113 |
| 6. | The system SHOULD provide the ability to manage information regarding the information source (i.e. informant) of the problem. | DC.1.4.3#5 | NC | 114 |
| 7. | The system SHALL conform to function $\frac{RI.1.1.17}{RI.1.1.17}$ (Deprecate/Retract Record Entries) to enable the inactivation or deprecation of a problem. | DC.1.4.3#6 | NC | 115 |
| 8. | The system MAY provide the ability to update an inactive problem in order to re-activate it. | DC.1.4.3#7 | NC | 116 |
| 9. | The system SHOULD provide the ability to render the list in a user-defined sort order. | | NC | 0 |
| 10. | The system SHALL provide the ability to render only active problems. | DC.1.4.3#9 | NC | 117 |
| 11. | The system SHOULD provide the ability to link one or more problem(s) in the Problem list to encounters. | DC.1.4.3#10 | NC | 118 |
| 12. | The system MAY provide the ability to link one or more problem(s) in the Problem List to medications. | | NC | 119 |
| 13. | The system MAY provide the ability to link one or more problem(s) in the Problem list to orders. | | NC | 120 |
| 14. | The system MAY provide the ability to link one or more problem(s) in the Problem list to medical equipment. | | NC | 121 |
| 15. | The system MAY provide the ability to link one or more problem(s) in the Problem list to prosthetic/orthotic devices. | | NC | 122 |
| 16. | The system MAY provide the ability to link one or more problem(s) in the Problem list to notes. | | NC | 123 |
| 17. | The system SHALL provide the ability to link orders, medical equipment, prosthetic/orthotic devices, and medications to one or more codified problems. | | NC | 124 |
| 18. | The system SHALL provide the ability to capture free text problems and render them in a manner that distinguishes them from coded problem entries. | | NC | 125 |
| 19. | The system SHALL tag and render an indicator that interaction checking will not occur against free text problems. | | NC | 126 |
| 20. | The system SHALL provide the ability to capture a problem into the problem list using standardized coding schemas (e.g., ICD or SNOMED). | | NC | 127 |
| 21 | The system SHALL provide the ability to manage free text comments associated with the problem. | | NC | 128 |

| Section/Id#: Type: | Header/Function Name Conformance Criteria | Reference | Chg Ind | Row# |
|-----------------------|---|-----------|---------|------|
| 22. | The system MAY provide the ability to manage the severity of a problem using a standards based classification scheme. | | NC | 129 |
| 23. | The system SHOULD provide the ability to link actions taken and outcomes with a problem. | | NC | 130 |
| 24. | The system MAY provide the ability to manage problems for known genetically based illnesses (e.g., single allele carrier status of a genetic trait or disease) according to scope of practice, organizational policy, and/or jurisdictional law. | | NC | 131 |
| 25. | The system MAY provide the ability to manage a known single allele carrier status of a genetic trait or disease according to scope of practice, organizational policy, and/or jurisdictional law, and subject to patient's preferences and consent. | | NC | 132 |
| 26. | The system SHOULD provide the ability to manage the linking of problems on the problem list, i.e., creating hierarchies or nestings within the problem list. | | NC | 133 |
| CP.1.5 Function | Manage Health-Related Factors List | | NC | 134 |

Statement: Manage patient-specific health-related factors.

Description: A patient's strengths (positive factors) or weaknesses (negative factors) may impact a patient's care or recovery and may be recorded as part of the EHR to support the development of care plans and treatment options. Examples of health factors include family support, financial support, health insurance levels, overall health, personal health behaviors (e.g., tobacco, physical activity, sleep), body mass index, employment status/type, access to care, or education level. Note that heath factors may be included in the Problem list (CP.1.4) which may include problems or strengths (e.g., ambulatory status or addictions). An example of an active patient-specific strength is an elderly parent receiving care from an adult child during the adult child's summer break from college. A patient's care may be affected by certain positive or negative factors. For example, coverage by insurance (a positive health factor) versus unemployment (a negative health factor).

| 1. | The system SHALI Factors. | provide the ability to manage, as discrete data, patient-specific Health-Related | | NC | 135 |
|--------------------|------------------------------------|--|----------|----|-----|
| 2. | The system SHAL specific Health-Re | L provide the ability to manage the source of information regarding patient-lated Factors. | | NC | 136 |
| 3. | • | L conform to function RI.1.1.17 (Deprecate/Retract Record Entries) to enable deprecation of a patient-specific Health-Related Factors. | | NC | 137 |
| 4. | • | provide the ability to update a patient-specific Health-Related Factors to resly deactivated patient-specific Health-Related Factors. | | NC | 138 |
| 5. | | ILD provide the ability to link encounters, orders, medications and notes to one ecific Health-Related Factors. | | NC | 139 |
| 6. | • | LD provide the ability to capture a patient-specific Health-Related Factors using ng schemes (e.g., a standardized Nursing Diagnosis coding system). | | NC | 140 |
| 7. | | LD provide the ability to capture free text patient-specific Health-Related Factors a manner that distinguishes them from coded patient-specific Health-Related | | NC | 141 |
| 8. | • | JLD tag and render an indicator that interaction checking will not occur against pecific Health-Related Factors. | | NC | 142 |
| 9. | The system SHOL specific Health-Re | JLD provide the ability to manage free text comments associated with patient-lated Factors. | | NC | 143 |
| 10. | • | LD provide the ability to link actions taken (e.g., placing an order for home health is (e.g., family providing additional home support) with patient-specific Health-i.g., living alone). | | NC | 144 |
| CP.1.6 Function | | Manage Immunization List | DC.1.4.4 | NC | 145 |

Statement: Create and maintain patient-specific immunization lists.

Description: Immunization lists are managed over time, whether over the course of a visit or stay, or the lifetime of a patient. Details of immunizations administered are captured as discrete data elements including date, type, manufacturer and lot number. The entire immunization history is viewable.

| The system SHOULD provide the ability to manage all immunizations associated with a patient. | DC.1.4.4#1 | NC | 146 |
|---|------------|----|-----|
| 2. The system SHOULD provide the ability to maintain immunization details, as discrete data, including: - the immunization name/type, sequence number in the series & series identifier, strength and dose; - the date and time of administration; - manufacturer, lot number, expiration date, - route and site of administration; - administering provider; - observations, reactions and complications; - reason immunization not given, and/or immunization related activity not performed; according to scope of practice, organizational policy, and/or jurisdictional law. | | NC | 147 |
| 3. The system SHALL provide the ability to manage, as discrete elements, data associated with an immunization that was not given to a patient (e.g., due to a contraindication or a patient's refusal). Data associated with an immunization that was not given to a patient includes date-and-time, immunization type, series, exception reason, and immunization-withholding provider. | | NC | 148 |
| 4. The system SHALL provide the ability to render (e.g., print or transmit) a report of a patient's immunization history (e.g., for appropriate authorities such as schools, day-care centers or public health immunization registries) according to scope of practice, organizational policy, and/or jurisdictional law. | DC.1.4.4#3 | NC | 149 |

| Section/Id#: Type: | Header/Function Name Conformance Criteria | Reference | Chg Ind | Row# |
|-----------------------|---|-----------|---------|------|
| 5 | . The system SHALL provide the ability to capture the currently recommended date for a companion immunization (e.g., a subsequent or booster dose) with each immunization (if such a companion immunization is needed). | | NC | 150 |
| 6 | The system SHALL provide the ability to capture, maintain and render population-based immunization schedules from relevant public health immunization authorities (e.g., CDC for US realm). | | NC | 151 |
| CP.1.7 Function | Manage Medical Equipment, Prosthetic/Orthotic, Device List | | NC | 152 |

Statement: Create and maintain a patient-specific list of medical equipment, medical prosthetic, orthotic, and/or implantable devices.

Description: Details of medical equipment, orthotic/prosthetic, and/or devices are captured as discrete data elements including information such as device type, date issued, date implanted or manufactured, device model number, device serial/lot number, manufacturer, supplier, involved extremity, anatomical location, date of battery change, and other data elements which many be required to correctly identify and track the equipment/device. The list may link to external sources, such as the US Food and Drug Administration (FDA), so that the provider may be alerted if the medical device is recalled. The entire equipment, prosthetic, orthotic, and/or implantable device list is able to be rendered.

| CP.1.8 Function | | Manage Patient and Family Preferences | DC.1.3.1 | NC | 164 |
|--------------------|-------------------------------------|--|----------|----|-----|
| | . The system MAY | provide the ability to capture equipment or device maintenance instructions. | | NC | 163 |
| 10. | . The system MAY pmaintenance. | provide the ability to capture the date of the next scheduled equipment or device | | NC | 162 |
| 9. | • | L provide the ability to render a list of deactivated specialized medical equipment, c, or implantable devices including the reason for deactivation. | | NC | 161 |
| 8. | • | provide the ability to update an entry in the list to re-activate a previously alized medical equipment, medical prosthetic, orthotic, or implantable device. | | NC | 160 |
| 7. | an entry in the list | JLD provide the ability to tag as deactivated and capture reason for deactivation, twhen the specialized medical equipment, prosthetic, orthotic, or implantable r in use by the patient. | | NC | 159 |
| 6. | information neces type, manufacture | ULD provide the ability to capture, maintain and render, as discrete data, sary to identify and track the equipment/device including, at a minimum: er, manufacture date, date implanted (or placed into service), date removed/lel/serial number, anatomical location and any unique device identifier (e.g., UDI | | NC | 158 |
| 5. | , | L provide the ability to capture an indication of No Known specialized medical etic, orthotic, and/or implantable device for the patient. | | NC | 157 |
| 4. | • | LL provide the ability to capture, maintain and render the specific type of al equipment, prosthetic, orthotic, and/or implantable device. | | NC | 156 |
| 3. | , | ULD provide the ability to capture, maintain and render the reason for each specialized medical equipment, prosthetic, orthotic, and/or implantable device. | | NC | 155 |
| 2. | | LL provide the ability to capture, maintain and render, as discrete data, the h instance of use of specialized medical equipment, prosthetic, orthotic, and/or e. | | NC | 154 |
| 1. | , | LL provide the ability to manage, as discrete data, a patient-specific list of all equipment, prosthetic, orthotic, and/or implantable devices. | | NC | 153 |

Statement: Capture and maintain patient and family preferences.

Description: This function is focused on the capture and maintenance of facts on patient/family preferences. Patient and family preferences regarding issues such as language, religion, spiritual practices and culture may be important to the delivery of care. It is important to capture these so that they will be available to the provider at the point of care. Patient/Family preferences differ from social history and Advance Directives as follows: Social history refers primarily to elements of a patient's background that may impact on the patient's health (e.g., smoking, drinking, occupation, abuse, etc.). Advance Directives refers to requests regarding care when the patient is unable to competently make decisions about their own care (e.g., Do Not Resuscitate orders, living wills).

| The system SHALL provide the ability to manage patient preferences (e.g., language(s), religion, spiritual and cultural practices). | DC.1.3.1#1 | NC | 165 |
|---|------------|----|-----|
| The system SHALL provide the ability to manage family preferences (e.g., language(s), religion, spiritual and cultural practices). | DC.1.3.1#2 | NC | 166 |
| The system SHOULD provide the ability to manage patient and family preferences based on business rules. | DC.1.3.1#3 | NC | 167 |
| 4. The system SHOULD provide the ability to render, at appropriate decision points, patient and family preferences as they pertain to current and planned treatment plans and orders. | | NC | 168 |
| The system SHOULD provide the ability to integrate patient and family preferences with appropriate health education materials (e.g., dietary advice based on dietary preference). | | NC | 169 |
| The system SHOULD conform to function <u>CPS.1.7.1</u> (Support for Patient and Family Preferences). | | NC | 0 |

|-----------------------|---|------------|---------|------|
| CP.2.5 Function | Manage Patient-Originated Data | DC.1.1.3.2 | NC | 184 |

Statement: Capture and explicitly label patient-originated data, link the data source with the data, and support provider authentication for inclusion in patient health record as well as subsequent rendering of the information as part of the health record.

Description: It is critically important to be able to distinguish clinically authored and authenticated data from patient-originated data that is either provided by the patient for inclusion in the EHR or entered directly into the EHR by the patient from clinically authenticated data. Patients may provide data for entry into the health record or be given a mechanism for entering this data directly. Patient-originated data intended for use by providers will be available for their use.

Data about the patient may be appropriately provided by:

- the patient;
- a surrogate (parent, spouse, guardian) or
- an informant (teacher, lawyer, case worker)
- devices (e.g., blood pressure/sugar monitors).

An electronic health record may provide the ability for direct data entry by any of these. Patient-originated data may also be captured by devices and transmitted for inclusion into the electronic health record.

Data entered by any of these must be stored with source information. A provider must authenticate patient-originated data included in the patient's legal health record. A provider must be able to indicate they have verified the accuracy of patient-originated data (when appropriate and when a verification source is available) for inclusion in the patient record. Such verification does not have to occur at each individual data field and can be at a higher level of the data.

| CP.3 Header | | Manage Clinical Documentation | | NC | 191 |

Statement: Clinical Documentation must be managed including the capture of the documentation during an encounter, maintenance and appropriate rendering.

Description: Clinical documentation includes all documentation that the clinician may capture during the course of an encounter with the patient or relevant to the patient. This includes assessments, clinical measurements, clinical documents and notes, patient-specific care and treatment plans. Management of clinical documentation also includes the acknowledgement and amendments of documentation provided by other providers.

| CP.3.1 | Conduct Assessments | DC.1.5 | NC | 192 |
|----------|----------------------|--------|-----|-----|
| Function | Oblidati Assessments | DO.1.0 | 110 | 192 |

Statement: Create and maintain assessment information.

Description: During an encounter with a patient, the provider will conduct an assessment that is germane to the age, gender, developmental or functional state, medical and behavioral condition of the patient, such as growth charts, developmental profiles, and disease specific assessments. Wherever possible, this assessment should follow industry standard protocols although, for example, an assessment for an infant will have different content than one for an elderly patient. When a specific assessment template does not exist, a new, locally-defined assessment can be created, using the format and data elements of similar assessments whenever possible. (NOTE: A new assessment may not necessarily be unique, since a facility may copy an assessment from another facility.)

| 1. | The system SHOULD provide the ability to manage assessment information captured (e.g., age, gender, developmental state, and health condition) according to scope of practice, organizational policy, and/or jurisdictional law. | DC.1.5#3 | NC | 195 |

Statement: Create, addend, amend, correct, authenticate, maintain, present and close, as needed, transcribed or directly-entered clinical documentation and notes.

Description: Clinical documents and notes may be unstructured and created in a narrative form, which may be based on a template, graphic, audio, etc. The documents may also be structured documents that result from the capture of coded data. Each of these forms of clinical documentation is important and appropriate for different users and situations. To facilitate the management and documentation on how providers are responding to incoming data on orders and results, there may also be some free text or formal record on the providers' responsibility, and/or standard choices for disposition, such as Reviewed and Filed, Recall Patient, or Future Follow Up. The system may also provide support for documenting the clinician's differential diagnosis process.

| CP.3.4 Function | Manage Patient-Specific Care and Treatment Plans | DC.1.6.2 | NC | 253 |

Statement: Provide templates and forms for clinicians to use for care plans, guidelines and protocols during provision of care and care planning.

Description: During the provision of care, the clinician reviews and uses templates and forms to ensure consistent quality patient care. Care plans, guidelines or protocols may contain goals or targets for the patient, specific guidance to the providers, suggested orders, and nursing interventions, among other items, including alerts. Information such as Order sets for care plans may arrive from an external institution and need to be approved locally before being inserted into the care plan. Tracking of implementation or approval dates, modifications and relevancy to specific domains or context is provided. Transfer of treatment and care plans may be implemented electronically using, for example, templates, or by printing plans to paper.

|-----------------------|---|-----------|---------|------|
| CP.4 Function | Manage Orders | DC.1.7 | NC | 280 |

Statement: Provide the ability to manage clinical orders and results including medication, non-medication, diagnostic tests, blood products, other biologics and referrals, using order sets as appropriate.

Description: The provision of clinical care includes the need to order from a variety of treatments using order sets as appropriate as well as reviewing the results of treatment. Orders for treatments may include medications, non-medication therapies (e.g., physical therapy, special diet, immunizations, non-allopathic regimens); diagnostic care (e.g., laboratory, radiology); blood products and other biologics (e.g., blood transfusions, human growth hormones). Patients are often referred to other health care providers for more specialized diagnostic workup, and/or treatment. An effective EHR-S must include support and management of these processes and associated documentation.

| 1. | The system SHALL provide the ability to manage role-based, context-based, and/or user-based | NC | 28 |
|-----|---|----|----|
| 2. | order entry. The system SHALL provide the ability to manage the creation, renewal, modification and discontinuation of orders. | NC | 28 |
| 3. | The system SHALL provide the ability to render relevant, patient-specific laboratory test results when entering an order. | NC | 28 |
| 4. | The system SHALL provide the ability to manage the status of an order (e.g., open, completed, in process). | NC | 2 |
| 5. | The system MAY provide the ability to capture, maintain and render order entry with an appropriate registration process when the identity of the patient is unknown or in an urgent situation. | NC | 2 |
| 6. | The system SHOULD provide the ability to manage standing orders or orders that may be submitted by providers other than licensed providers according to scope of practice, organizational policy, and/or jurisdictional law. | NC | 2 |
| 7. | The system SHALL provide the ability to capture and render problem/diagnosis as an element of an order. | NC | 2 |
| 8. | The system MAY provide the ability to capture, maintain and render, as discrete data, a diagnosis/ problem code, and/or description associated with an order of any type (including prescriptions and medications ordered for administration). | NC | 2 |
| 9. | The system MAY provide the ability to link an order of any type (including medication order) with a related clinical problem(s), and/or diagnosis code(s) and description. | NC | 2 |
| 10. | The system SHALL provide the ability to annotate and render comments and instructions with an order. | NC | 2 |
| 11. | The system SHOULD provide the ability to annotate and render free text comments and instructions with an order (e.g., "Short draw, do CBC first"). | NC | 2 |
| 12. | The system SHOULD provide the ability to tag frequently used and institutionally-approved order sets as "favorites" or "preferences" to facilitate retrieval and ordering. | NC | 2 |
| 13. | The system MAY provide the ability to manage orders submitted to or received from external organizations, and/or facilities such as Health Information Exchanges (HIEs) or regional Electronic Health Record Systems (EHR-Ss). | NC | 2 |
| 14. | The system SHALL render patient identifying information (e.g., the patient name, identification number, and age or date of birth) on all order screens, according to scope of practice, organizational policy, and/or jurisdictional law. | NC | 2 |
| 15. | The system SHALL provide the ability to capture, maintain and render an indicator of oral verification ("read-back") of the complete order by the person receiving the telephone or verbal order. | NC | 2 |
| 16. | The system SHALL provide the ability to capture and render the urgency status (e.g., As-Soon-As-Possible or STAT) associated with an order. | NC | 2 |
| 17. | The system SHOULD provide the ability to render order history for any order, including the ordering clinician, order details, date, and time. | NC | 2 |
| 18. | The system SHOULD provide the ability to tag and render a field as required for a complete order by order type (e.g., pediatric order for antibiotic that requires the patient's weight). | NC | 2 |
| 19. | The system SHOULD provide the ability to tag orders to be activated at a future date and time including admission orders, discharge orders, and post-operative orders. | NC | 2 |
| 20. | The system MAY provide the ability to manage conditional orders that can be activated when certain criteria and conditions are met. | NC | 3 |
| 21. | The system SHALL provide the ability to capture, store and render the identity of all providers who signed an order including their name and credential identifier. | NC | 3 |
| 22. | The system SHOULD provide the ability to render a list of active orders for a patient. | NC | 3 |

| CP.4.1 Function | | Use Order Sets | DC.1.7.3 | NC | 308 |

Statement: Use Order Set templates to facilitate order entry by rendering the appropriate orders based on provider request, input or system configuration.

Description: Predefined order set templates may include medication and non-medication orders (e.g., diet, activities, nursing care, prescriptions and requests for investigations). They allow a care provider to choose common orders for a particular circumstance or disease state according to standards or other criteria such as provider preference. Recommended order set templates may be presented based on patient data or other contexts. Order Set templates may also allow the provider to modify (add/remove/change) orders during order entry for a particular patient.

| | 1. | • | L provide the ability to capture a set of actions, and/or items to be ordered for redefined order set template. | | NC | 309 |

Statement: Create prescriptions or other medication orders with detail adequate for correct filling and administration. Provide information regarding compliance of medication orders with formularies. Provide drug utilization review functionality including alerts regarding drug interactions and allergies.

Description: Medications include prescribed and over the counter (OTC) drugs, allergy shots, oxygen, anesthetics, chemotherapy, and dietary supplements that were ordered, supplied, administered, or continued. Different medication orders, including new, discontinue, refill/continue, and renew require different levels and kinds of detail, as do medication orders placed in different situations. Administration or patient instructions are available for selection by the ordering clinician, or the ordering clinician is facilitated in creating such instructions. The system may allow for the creation of common content for prescription details. Appropriate time stamps for all medication related activity are generated. This includes series of orders that are part of a therapeutic regimen, e.g., Renal Dialysis, Oncology. When it comes to capturing the medication rationale, it is not mandatory that the provider always provide this information.

In addition, the system should present the clinician with clinical decision support functionality (such as the presentation of allergies, drugdrug interactions) during the medication ordering process. When a clinician places an order for a medication, that order may or may not comply with a formulary specific to the patient's location or insurance coverage, if applicable. Whether the order complies with the formulary should be communicated to the ordering clinician at an appropriate point to allow the ordering clinician to decide whether to continue with the order. Formulary-compliant alternatives to the medication being ordered may also be presented.

| 1. The System SHALL conform to function CP.4.2.1 (Medication Interaction and Allergy Checking). | NC | 321 |
|---|----|-----|
| The System SHALL conform to function <u>CP.4.2.2</u> (Patient-Specific Medication Dosing & Warnings). | NC | 322 |
| 3. The System SHALL conform to function CP.4.2.3 (Medication Order Efficiencies). | NC | 323 |
| 4. The system SHALL conform to function CP.4.2.4 (Medication Alert Overrides). | NC | 324 |
| The system SHALL provide the ability to capture medication order details as discrete data for correct filling, dispensing and administration of drug (e.g., dose, route, physical form, duration, SIG). | NC | 325 |

| Section/Id#: Type: | Header/Function Name Conformance Criteria | Reference | Chg Ind | Row# |

Statement: Enable the origination, documentation, capture, transmission, tracking and maintenance of non-medication patient care orders.

Description: Non-medication orders that request actions or items can be captured and tracked including new, renewal and discontinue orders. Examples include orders to transfer a patient between units, to ambulate a patient, for medical supplies, wound care, durable medical equipment, home IV, and diet or therapy orders. Additionally, psychotherapy and other mental health counseling, behavioral counseling (e.g., smoking cessation, alcohol treatment) other surgical and non-surgical procedures, and complementary alternative medicine are included in non-medication treatments. Each item ordered includes the appropriate detail, such as order identification and instructions. Orders should be communicated to the correct service provider for completion.

| P.4.4 unction | Manage Orders for Diagnostic/Screening Tests | DC.1.7.2.2 | NC | 409 |

Description: Orders for diagnostic tests (e.g., diagnostic radiology, laboratory) are captured and tracked including new, renewal and discontinue orders. Each order includes appropriate detail, such as order identification, instructions and clinical information necessary to perform the test. Orders and supporting detailed documentation shall be communicated to the service provider for completion of the diagnostic test(s). Some systems may contain instructions, but in some settings, instructions may be provided from external sources (e.g., handouts).

Statement: Communicate with appropriate sources or registries to manage orders for blood products or other biologics.

Description: Interact with a blood bank system or other source to support orders for blood products or other biologics including discontinuance orders. Use of such products in the provision of care is captured. Blood bank or other functionality that may come under jurisdictional law or other regulation (e.g., by the FDA in the United States) is not required; functional communication with such a system is required.

| 1. The system SHALL provide the ability to manage orders for blood products and biological products. | NC | 423 |
|---|----|-----|

| CP.4.6 Function | | Manage Orders for Referral | DC.1.7.2.4 | NC | 430 |

Statement: Enable the origination, documentation and tracking of referrals between care providers or healthcare organizations, including clinical and administrative details of the referral, and consents and authorizations for disclosures as required.

Description: Documentation and tracking of a referral from one care provider to another is supported, whether the referred to or referring providers are internal or external to the healthcare organization. Guidelines for whether a particular referral for a particular patient is appropriate in a clinical context and with regard to administrative factors such as insurance may be provided to the care provider at the time the referral is created. The EHR-S provides the ability to receive and act upon referral responses from providers. The EHR-S may provide the ability to capture completion of the referral appointment. Referrals may be received electronically (i.e. e-Referrals); or may be received non-electronically. If non-electronic, the system needs to allow the user to capture the referral information and manage referral request. If the system supports e-Referrals, then the system will also need to support additional functionality to manage the receipt of the referral request.

| CP.5 Function | | Manage Results | DC.1.8.3 | NC | 443 |

Statement: Present, annotate, and route current and historical test results to appropriate providers for review. Provide the ability to filter and compare results.

Description: Results of tests are presented in an easily accessible manner to the appropriate providers. For example, flow sheets, graphs, or other tools allow care providers to view or uncover trends in test data over time. The provider may desire to annotate, filter, and/ or compare results. In addition to making results viewable, it is often necessary to send results to appropriate providers using electronic messaging systems, pagers, or other mechanisms. In addition, the system may have the ability to redirect or copy specific test results to a specified individual. Documentation of notification is accommodated. Results may also be routed to patients electronically or non-electronically (e.g., by hard copy). Note: "Results" are understood as applying to any type of test, whether biological or psychological. Management of the results may also require the provider's communication of the results to the patient (see function CPS.8.4 (Support for Communications between Provider and the Patient, and/or the Patient's Representative)). There may also be a need to notify public health agencies based on the result. See function POP.2 (Support Population-based Epidemiological Investigation).

|-----------------------|--|-----------|---------|------|
| 3 | The system SHOULD provide the ability to capture, maintain and render microbiology laboratory results (with sensitivity testing) using standard coding methodology according to scope of practice, organizational policy, and/or jurisdictional law. | | NC | 477 |
| 4 | The system SHOULD provide the ability to capture, maintain and render laboratory results that identify new and emerging laboratory procedures (e.g., processes that examine emerging organisms, new processes that examine existing organisms). | | NC | 478 |
| 5 | The system SHALL provide the ability to capture, maintain and render discrete diagnostic results received through an electronic interface. | | NC | 479 |
| 6 | The system SHALL provide the ability to render indicators of normal and abnormal diagnostic results based on information provided from the original source (e.g., from a laboratory or radiology department). | | NC | 480 |
| CP.6 Header | Manage Medication, Immunization and Treatment Administration | | NC | 481 |

Statement: Provide the functionality required to support the management of medication and immunization administration.

Description: Provide the functionality required to support the safe administration of medications or immunizations to a patient based on medical requirement and orders within the system. This includes presenting providers with the list of medications or immunizations that are to be administered to a patient, necessary administration information, and capture all required and relevant administration details.

| CP.6.1 | Manage Medication Administration | DC.1.8.1 | NC | 482 |
|----------|------------------------------------|----------|-----|-----|
| Function | Manage Medication / tarming ration | DO.1.0.1 | 110 | 402 |

Statement: Present providers with the list of medications that are to be administered to a patient, necessary administration information, and capture administration details.

Description: In a setting in which medication orders are to be administered by a provider rather than the patient, the necessary information is presented including: the list of medication orders that are to be administered; administration instructions, times or other conditions of administration; dose and route, etc. The system shall securely relate medications to be administered to the unique identity of the patient (see <u>CPS.1.1</u>). Additionally, the provider can record what actually was or was not administered, whether or not these facts conform to the order. Appropriate time stamps for all medication related activity are generated.

For some settings that administer complete sets of medications from a variety of providers' orders, it may be useful to provide an additional check for possible drug-drug or other interactions.

The EHR system shall support the five "rights" - Right Patient, Right Drug, Right Dose, Right Route, Right Time.

The system should report medication administration, where appropriate, to public health or disease management authorities (e.g., oncology related medication orders should be communicated or transmitted to a cancer registry).

| | ,,, | | | |
|-----|--|------------|----|-----|
| 1. | The system SHALL provide the ability to render the list of medications that are to be administered. | DC.1.8.1#1 | NC | 483 |
| 2. | The system SHALL provide the ability to render the list of medications that are to be administered including all administration directions/instructions (SIG). | DC.1.8.1#3 | NC | 484 |
| 3. | The system SHOULD provide the ability to render medications as dispensed (including dose and quantity of dispensed units of medication). | | NC | 485 |
| 4. | The system SHOULD provide the ability to tag the medications that are to be administered by the patient (i.e. self-administered). | | NC | 486 |
| 5. | The system SHALL provide the ability to render the drug, dose, route, time and frequency of desired administration for all scheduled medications. | DC.1.8.1#2 | NC | 487 |
| 6. | The system SHOULD provide the ability to render a notification to the clinician when specific doses are due. | DC.1.8.1#4 | NC | 488 |
| 7. | The system SHOULD provide the ability to render a notification when medication related activities are due (e.g., adjusting medication dosing based on patient condition, checking IV lines for infiltration). | | NC | 489 |
| 8. | The system SHALL conform to function CPS.4.2.1 (Support for Medication Interaction and Allergy Checking) in order to determine and render allergies, drug-drug interactions, and other potential adverse reactions, when rendering medication administration information. | DC.1.8.1#5 | NC | 490 |
| 9. | The system SHALL conform to function CPS.4.2.2 (Support for Patient-Specific Dosing and Warnings) in order to determine and render other potential adverse reactions, when rendering medication administration information. | DC.1.8.1#6 | NC | 491 |
| 10. | The system SHALL provide the ability to capture and maintain the medication identification number of the drug administered to the patient (e.g., NDC number, lot numbers, expiration date). | | NC | 492 |
| 11. | The system SHALL provide the ability to capture, maintain and render medication administration details as discrete data, including:(1) the medication name, strength and dose;(2) date and time of administration;(3) route and site;(4) administering provider(5) observations, reactions and complications(6) reason medication not given, and/or medication related activity not performed; according to scope of practice, organizational policy, and/or jurisdictional law. | DC.1.8.1#7 | NC | 493 |
| 12. | The system SHOULD provide the ability to capture the effectiveness of PRN or "as needed" doses after they have been administered. | | NC | 494 |
| 13. | The system SHOULD provide the ability to render any clinical interventions or assessments required prior to medication administration. | | NC | 495 |

| Section/Id#: Type: | Header/Function Name Conformance Criteria | Reference | Chg Ind | Row# |
|-----------------------|---|------------|---------|------|
| 14. | The system SHOULD provide the ability to render any clinical interventions or assessments required subsequent to medication administration. | | NC | 496 |
| 15. | The system SHOULD provide the ability to securely link medication-related activities to the unique identity of the patient (e.g., verification of administration to correct patient). | DC.1.8.1#8 | NC | 497 |
| 16. | The system SHOULD provide the ability to capture the identification of medication samples dispensed, including lot number and expiration date. | | NC | 498 |
| 17. | The system SHOULD support integrated point of care devices for patient and medication identification, such as barcode recognition verification of patients and medications. | | NC | 499 |
| 18. | $\label{thm:continuous} The \ system \ SHOULD \ provide \ the \ ability \ to \ render \ medication \ orders \ that \ have \ not \ been \ dispensed.$ | | NC | 500 |
| 19. | The system SHOULD provide the ability to render medication orders that have not been administered. | | NC | 501 |
| 20. | The system SHOULD render an alert, when rendering administration information, if a maximum individual or daily dose exists and further administration would cause these to be exceeded (e.g., in the case of a PRN order with weight-based or BSA-based dose limits). | | NC | 502 |
| 21. | The system SHOULD provide the ability to render medications to be administered over a selectable date/time range. | | NC | 503 |
| 22. | The system SHALL provide the ability to render the medication administration history including administering provider, date, and time. | | NC | 504 |
| 23. | The system SHOULD provide the ability to render continuous infusions in a manner that distinguishes them from other discrete-dose medications (e.g., insulin drip versus subcutaneous insulin dose). | | NC | 505 |
| 24. | The system SHOULD provide the ability to render PRN ("as needed") medications in a manner that distinguishes them from other medications. | | NC | 506 |
| 25. | The system SHOULD provide the ability to annotate an individual scheduled medication dose and include the annotation as part of the legal medical record. (e.g., describe the dose to be administered based upon specific clinical indicators such as a sliding scale insulin order where the dose is based upon the patients current blood sugar level) | | NC | 507 |
| 26. | The system SHALL provide the ability to render the medication order as written (i.e., exact clinician order language) when rendering administration information. | | NC | 508 |
| 27. | The system SHALL provide the ability to capture and render patient-specific instructions or other free text related to the administration of the medication (e.g., use left-arm IV only) | | NC | 509 |
| 28. | The system SHALL provide the ability to manage information regarding a second provider witness to co-document administration. | | NC | 510 |
| 29. | The system SHOULD provide the ability to capture the documentation of medication administration using a barcode scanner or imaging scanner (e.g., scanner capable of reading two dimensional symbologies). | | NC | 511 |
| 30. | The system SHOULD provide the ability to render an alert to the administering provider when an electronic identification device (e.g., barcode & scanner or RFID) is used to document the administration of the medication and one of the following is in error: right patient, right medication, right dose, right time, or right route or there has not been positive identification of the administering provider. | | NC | 512 |
| 31. | The system SHOULD provide the ability to manage medication administration schedules on the record of medication administration - to allow user to adjust future authorized schedule as needed (e.g., delay, refused, unavailable). | | NC | 513 |
| 32. | The system SHOULD provide the ability to render a notification to associated systems (e.g., pharmacy, ordering, food and nutrition services) of changes in schedules on the record of medication administration. | | NC | 514 |
| 33. | The system SHOULD provide the ability to capture an acknowledgement from a user that a medication order has been reviewed including capturing the date, time and user credentials. | | NC | 515 |
| 34. | The system SHOULD provide the ability to capture documentation of medication administration prior to pharmacy review. | | NC | 516 |
| 35. | The system SHALL provide the ability to capture, maintain and render as part of the medication administration record for infusions the actual date and times of the infusion including the start and stop times and any modifications to the infusion and the assessment status of the infusion. | | NC | 517 |
| 36. | The system SHOULD provide the ability to capture, maintain, and render the patient's consent to have restricted medications administered, (e.g., Risk Evaluation and Mitigation Strategy (REMS)). | | NC | 518 |
| 37. | The system MAY auto-populate the medication administration record as a by-product of verification of administering provider, patient, medication, dose, route and time according to scope of practice, organizational policy, and/or jurisdictional law. | DC.2.3.2#6 | NC | 519 |
| 38. | The system SHOULD provide the ability to capture, maintain, and present physiological parameters or task completion that must be checked and recorded prior to medication administration. | | NC | 520 |
| 39. | The system SHOULD provide the ability to capture and maintain documentation that the right patient, right medication, right dose, right time, and right route were verified (e.g., using positive ID technology such as bar code scanning) at the time of administration. | | NC | 521 |

| Pi | rovide the ability to render a medication unique identifier (e.g., NDC, Structured PL) in the U.S. Realm or other standard product identifiers) according to | | NC | 522 |
| CP.6.2 Function | Manage Immunization Administration | DC.1.8.2 | NC | 523 |

Statement: Capture and maintain discrete data concerning immunizations given to a patient including date administered, type, manufacturer, lot number, and any allergic or adverse reactions. Facilitate the interaction with an immunization registry to allow maintenance of a patient's immunization history.

Description: During an encounter, recommendations based on accepted immunization schedules are presented to the provider. Allergen and adverse reaction histories are checked prior to giving the immunization. If an immunization is administered, discrete data elements associated with the immunization including date, type, immunization expiration date, manufacturer and lot number are recorded. Any new adverse or allergic reactions are noted. If required, a report is made to the public health immunization registry or other organization (e.g., military unit commander, refugee program leadership). This function should include the ability to use GTIN barcode scanners to capture vaccine information (NDC, lot number, expiration date).

| capt | ture vaccine information (NDC, lot number, expiration date). | | | |
|------|--|-------------|----|-----|
| | The system SHALL provide the ability to capture immunization administration details as discrete data, including:(1) the immunization name/type, series, strength and dose;(2) date and time of administration;(3) manufacturer, lot number, expiration date,(4) route and site of administration; (5) administering provider;(6) observations, reactions and complications;(7) reason immunization not given, and/or immunization related activity not performed;according to scope of practice, organizational policy, and/or jurisdictional law. | DC.1.8.2#4 | NC | 524 |
| 2. | The system MAY auto-populate the immunization administration record as a by-product of verification of administering provider, patient, medication, dose, route and time according to scope of practice, organizational policy, and/or jurisdictional law. | DC.2.3.2#6 | NC | 525 |
| 3. | The system SHALL provide the ability to determine and render required immunizations, and when they are due, based on widely accepted immunization schedules, when rendering encounter information. | DC.1.8.2#1 | NC | 526 |
| 4. | The system SHOULD provide the ability to capture, in a discrete field, an allergy/adverse reaction to a specific immunization. | | NC | 527 |
| 5. | The system SHALL conform to function CP.3.2 (Manage Patient Clinical Measurements) to capture other clinical data pertinent to the immunization administration (e.g., vital signs). | DC.1.8.2#5 | NC | 528 |
| 6. | The system SHOULD provide the ability to link standard codes (e.g., LOINC, SNOMED or other jurisdictionally-specific codes) with discrete data elements associated with an immunization. | DC.1.8.2#7 | NC | 529 |
| 7. | The system SHALL provide the ability to maintain a patient-specific immunization schedule. | DC.1.8.2#8 | NC | 530 |
| 8. | The system SHALL provide the ability to render a patient's immunization history upon request for appropriate authorities such as schools or day-care centers. | DC.1.8.2#9 | NC | 531 |
| 9. | The system SHALL conform to function CP.1.2 (Manage Allergy, Intolerance and Adverse Reaction List). | DC.1.8.2#10 | NC | 532 |
| 10. | The system SHOULD transmit required immunization administration information to a public health immunization registry according to scope of practice, organizational policy, and/or jurisdictional law. | DC.1.8.2#11 | NC | 533 |
| 11. | The system SHOULD exchange immunization histories with public health immunization registries or Immunization Information Systems according to scope of practice, organizational policy, and/or jurisdictional law. | DC.1.8.2#12 | NC | 534 |
| 12. | The system SHOULD harmonize Immunization histories with a public health immunization registry or Immunization information Systems according to scope of practice, organizational policy, and/or jurisdictional law. | DC.1.8.2#15 | NC | 535 |
| 13. | The system SHOULD capture and render immunization histories from a public health immunization registry or Immunization Information Systems including immunization administration recommendations. | | NC | 536 |
| 14. | The system SHALL conform to function CP.1.6 (Manage Immunization List). | | NC | 537 |
| 15. | The system SHOULD provide the ability to update immunization histories at the time of capturing an immunization administration. | | NC | 538 |
| 16. | The system SHALL provide the ability to render an immunization order as written (e.g., exact clinician order language or as mandated - such as by a public health requirement), when rendering administration information. | | NC | 539 |
| 17. | The system SHALL provide the ability to determine due and overdue ordered immunizations including earliest through latest date ranges and render a notification according to organizational policy, and/or jurisdictional law. | | NC | 540 |
| 18. | The system SHALL provide the ability to render a patient educational information regarding the administration (e.g., Vaccine Information Statement (VIS). | | NC | 541 |
| 19. | The system SHALL provide the ability to capture that patient educational information (e.g., VIS) was provided at the time of immunization administration. | | NC | 542 |
| 20. | The system SHOULD provide the ability to capture that patient educational information (e.g., VIS) was provided at the time of the immunization including to whom the information was provided and the date/time that it was provided. | | NC | 543 |

| Section/Id#: Type: | Header/Function Name Conformance Criteria | Reference | Chg Ind | Row# |
|-----------------------|--|-----------|---------|------|
| 21. | 21. The system SHOULD provide the ability to capture and maintain immunization refusal reasons as discrete data. | | NC | 544 |
| 22. | The system SHOULD provide the ability to capture patient preferences regarding receipt of immunization (e.g., refusal of certain vaccines) at time of immunization administration. | | NC | 545 |
| CP.6.3 Function | Manage Treatment Administration | | NC | 546 |

Statement: Provide the functionality required to support the management of treatment administration and documentation. (Treatment defined as the administration or application of remedies to a patient for a disease or injury; medicinal or surgical management; therapy.)

Description: Provide the functionality required to support the documentation of non-medication treatments (e.g., wound dressing change that includes use of a topical cream or sterile wash during that process) to a patient based on clinical needs and requirements and provider orders within the system. This includes presenting end users with the list of clinical treatments that are to be administered to a patient, necessary administration information, and capture all required and relevant documentation details.

| patie | ent, necessary administration information, and capture all required and relevant documentation details. | | |
|-------|--|----|----|
| 1. | The system SHALL provide the ability to render the list of treatments that are to be administered within a specified time frame and including all administration directions/instructions. | NC | 54 |
| 2. | The system SHALL conform to function <u>CP.6.1</u> (Medication Administration) to support the administration of medications as part of the treatment administration. | NC | 54 |
| 3. | The system SHOULD provide the ability to render all medications associated with the treatment as given or administered (including dose and quantity of dispensed units of medication). | NC | 54 |
| 4. | The system SHOULD provide the ability to tag the treatments that are to be administered by the patient (i.e. self-administered). | NC | 55 |
| 5. | The system SHALL provide the ability to render the information necessary to adminster the treatment (e.g., body site, time and frequency). | NC | 55 |
| 6. | The system SHALL provide the ability to document multiple body sites of desired administration for all scheduled treatments. | NC | 55 |
| 7. | The system SHOULD provide the ability to render a notification when treatments are due. | NC | 55 |
| 8. | The system SHALL provide the ability to capture, maintain and render details associated with the treatment as discrete data, including: treatment; date and time of treatment; site; administering provider; observations, reactions and complications; and reason treatment not given, and/or related activity not performed; according to scope of practice, organizational policy, and/or jurisdictional law. | NC | 55 |
| 9. | The system SHOULD provide the ability to capture, maintain and render details associated with continuous treatments (e.g., infusions, tube feedings, bladder irrigations, suction levels). | NC | 55 |
| 10. | The system SHALL provide the ability to capture, maintain and render details associated with treatments (including routinely scheduled, "one-time", "on-call" and "PRN") in a manner that distinguishes them from other types of treatments according to scope of practice. | NC | 55 |
| 11. | The system SHOULD provide the ability to capture information regarding the effectiveness of treatment at the time of administration of the treatment (e.g., patient's immediate response to bronchodilator therapy). | NC | 55 |
| 12. | The system SHOULD provide the ability to render any clinical interventions or assessments required prior to the treatment. | NC | 55 |
| 13. | The system SHOULD provide the ability to render any clinical interventions or assessments required subsequent to the treatment. | NC | 55 |
| 14. | The system SHALL provide the ability to capture verification of patient identity prior to administration of the treatment. | NC | 56 |
| 15. | The system SHOULD provide the ability to capture verification of patient identity using integrated point of care devices (e.g., barcode) prior to administration of the treatment. | NC | 56 |
| 16. | The system SHOULD provide the ability to render treatment orders that have not been administered. | NC | 56 |
| 17. | The system SHOULD provide the ability to render treatments to be administered over a selectable date/time range. | NC | 56 |
| 18. | The system SHALL provide the ability to render the treatment administration history including administering provider date and time. | NC | 56 |
| 19. | The system SHALL provide the ability to render prior treatment history (including treatment assessment data and patient response) prior to the administration of the treatment. | NC | 56 |
| 20. | The system SHOULD provide the ability to annotate an individual scheduled treatment and include the annotation as part of the legal medical record(e.g., describe the treatment to be administered based upon specific clinical indicators). | NC | 56 |
| 21. | The system SHALL provide the ability to render the treatment order as written (i.e., exact clinician order language) when rendering treatment specific information including special instructions. | NC | 56 |
| 22. | The system SHALL provide the ability to capture and render patient-specific instructions related to the treatment. | NC | 56 |
| 23. | The system SHALL provide the ability to manage information regarding a second provider witness to co-document treatment. | NC | 56 |

| CP.7.2 Function | Manage Recommendations for Future Care | | NC | 589 |

Statement: Document and support the management of the disposition process for a patient by managing recommendations for future care

Description: Patient encounters or treatments can end in many different states and support for these requires that the EHR support the ability to capture and maintain recommendations for the further future care of the patient. The EHR should accommodate, at a minimum, the following possible recommendations for future care (or dispositions) along with other supporting information for the recommendations:

- discharge,
- admission,
- transfer,
- death.
- left without being seen (LWBS),
- left without treatment (LWOT),
- elopements (i.e. leaving without notifying the facility or wandering),
- left against medical advice (AMA),
- patients triaged to other clinics, and
- administrative errors.

| | 6. | . The system SHOULD provide the ability to link the recommendation for future care with the original documentation of that recommendation. | | | NC | 595 |
| | 7. | The system SHOULD provide the ability to link the recommendation with condition(s) on the Problem List. | | | NC | 596 |
| CP.8 Header | | _ | Manage Patient Education & Communication | | NC | 597 |

Statement: Provide the functionality to effectively communicate with the patient regarding their care and document the communication as part of the patient's medical record.

Description: During an encounter with a patient or when any medical decision is made that affects the patient and requires action from the patient it is necessary to communicate effectively with the patient (or their representative) to ensure that they can participate appropriately in their care. This includes providing instructions pertaining to preparation for a procedure, self-administration of medications and self care.

| CP.8.1 | Generate, Record and Distribute Patient-Specific Instructions | DC.1.9 | NC | 598 |
|--------|---|--------|----|-----|
| | | | | |

Statement: Generate and record patient-specific instructions related to pre- and post-procedural and post-treatment/discharge requirements.

Description: When a patient is scheduled for a test, procedure, or discharge, specific instructions about diet, clothing, transportation assistance, convalescence, follow-up with physician, etc., may be generated and recorded, including the timing relative to the scheduled event. In an outpatient scenario, similar instructions for post-diagnosis, and/or post-treatment needs may also be generated and recorded (e.g., exercise instructions for low back pain, wound or burn care).

| 1 | The system SHALL provide the ability to determine and render standardized instruction sets pertinent to the patient condition, for procedures, or scheduled events. | DC.1.9#1 | NC | 599 |
|---|---|----------|----|-----|
| 2 | The system SHALL provide the ability to render instructions pertinent to the patient as selected by the provider. | DC.1.9#2 | NC | 600 |
| 3 | The system SHOULD provide the ability to transmit instruction information in electronic format to be provided to the patient. | DC.1.9#3 | NC | 601 |
| 4 | The system SHALL provide the ability to render as part of patient instructions details on further care such as follow up, return visits and appropriate timing of further care. | DC.1.9#4 | NC | 602 |
| 5 | The system SHALL provide the ability to capture an indication that instructions were given to the patient. | DC.1.9#5 | NC | 603 |

3. Care Provision Support Section

Section Overview

The Care Provision Support Section focusses on functions required to support the provision of care to a specific patient to enable hands-on delivery of healthcare. This section is organized generally in alignment with Care Provision Section. For example, CP.4 (Manage Orders) is supported directly by CPS.4 (Support Orders). This alignment is designed to assist in finding related support functions related to care provision functions but is not expected to be 100% matched as some Care Provision Functions do not require matching Support functions or vice-versa. All functions within the Care Provision Support Section have an identifier starting with "CPS".

| Section/ld#: Type: | Header/Function Name Conformance Criteria | Reference | Chg Ind | Row# |
|-----------------------|---|-----------|---------|------|
| CPS.1 Header | Record Management | DC.1.1 | NC | 623 |

Statement: Manage the patient record including all patient demographics, identifiers and other information to support the provision of care.

Description: Management of the patient record includes creation through quick registration or through a captured referral request as well as managing the patient encounter information linked to the appropriate patient record. It is also critical to manage the patient's relationships through genealogy, insurance, living situation or other means. This section also includes support for the management of patient and family preferences including patient advance directives, consents and authorizations linked to the unique patient record. For those functions related to data capture, data should be captured using standardized code sets or nomenclature, depending on the nature of the data, or captured as unstructured data. Care-setting dependent data are entered by a variety of caregivers. Data may also be captured from devices or other tele-health applications.

| CPS.1.1 | Manage a Patient Record | DC.1.1.1 | NC | 624 |
|----------|-------------------------|----------|-----|-----|
| Function | Manage a Fallent Necolu | DC.1.1.1 | INC | 024 |

Statement: Manage a single logical record for each patient.

Description: A single record is needed for legal purposes, as well as to organize it unambiguously for the provider. Health information is captured and linked to the patient record. Static data elements as well as data elements that will change over time are maintained. The patient is uniquely identified, after which the record is tied to that patient. Combining information on the same patient, or separating information where it was inadvertently captured for the wrong patient, helps maintain health information for a single patient. In the process of creating a patient record, it is at times advantageous to replicate identical information across multiple records, so that such data does not have to be re-entered. For example, when a parent registers children as new patients, the address, guarantor, and insurance data may be propagated in the children's records without having to re-enter them.

| , | | | | |
|-----|---|------------|----|-----|
| 1. | The system SHALL manage a single logical record for each patient. | DC.1.1.1#1 | NC | 625 |
| 2. | The system SHALL provide the ability to determine the unique identity of a patient and link the record to a single patient. | DC.1.1.1#5 | NC | 626 |
| 3. | The system SHALL provide the ability to manage a record for a patient when the identity of the patient is unknown. | DC.1.1.1#2 | NC | 627 |
| 4. | The system SHOULD provide the ability to tag a record when the identity of the patient is unknown according to scope of practice, organizational policy, and/or jurisdictional law. | | NC | 628 |
| 5. | The system SHALL provide the ability to manage more than one patient identifier for each patient record. | DC.1.1.1#3 | NC | 629 |
| 6. | The system SHALL link key patient identifier information (e.g., system ID, medical record number) to each patient record according to scope of practice, organizational policy, and/or jurisdictional law. | DC.1.1.1#4 | NC | 630 |
| 7. | The system SHOULD provide the ability to determine and render a patient by an alias and link the record to a single patient. | | NC | 631 |
| 8. | The system SHALL provide the ability, through a controlled method, to integrate or link information for an individual patient upon recognizing the identity of the patient (e.g., if portions of a record were not yet integrated or linked because the patient's identity was not yet known, or a temporary identity (an alias) was being used, or there were duplicate records). | DC.1.1.1#6 | NC | 632 |
| 9. | The system SHALL provide the ability, when health information has been mistakenly associated with a patient, to tag the information as erroneous in the record of the patient in which it was mistakenly associated and render that information as erroneous in all renderings (i.e., outputs) containing that information. | DC.1.1.1#7 | NC | 633 |
| 10. | The system SHALL provide the ability, when health information has been mistakenly associated with a patient, to link the health information with the correct patient and tag as erroneous in the wrong patient record. | DC.1.1.1#8 | NC | 634 |
| 11. | The system SHALL render appropriate health information that has been tagged as erroneous in a patient's record (e.g., identify as erroneous when rendering or render in audit logs only). | | NC | 635 |
| 12. | The system SHALL provide the ability to render parts of a single patient's record using a primary identifier (e.g., Unique patient identifier, encounter number), secondary identifiers (e.g., Social Security Number), or other information, or combination of information, which are not identifiers, but could be used to help identify the patient (e.g., name or Date of Birth). | DC.1.1.1#9 | NC | 636 |

| Section/Id#: Type: | | Header/Function Name Conformance Criteria | Reference | Chg Ind | Row# |
|-----------------------|------------------------------|--|-------------|---------|------|
| 13. | | provide the ability to tag as obsolete, inactivated or nullified, to store in archives patient's record in accordance with local policies and procedures, as well as d regulation. | DC.1.1.1#10 | NC | 637 |
| 14. | The system MAY p | rovide the ability to auto-populate identical data to all records of related patients. | DC.1.1.1#11 | NC | 638 |
| 15. | The system SHOL | ILD provide the ability to capture anonymized patient registration. | | NC | 639 |

| 18. | The system SHO demographics. | ULD provide the ability to link several patients that have some common | | NC | 642 |
| CPS.1.2 Function | | Manage Patient Demographics | DC.1.1.2 | NC | 643 |

Statement: Manage patient demographic information.

Description: Demographic information (including names, addresses, phone numbers, email addresses, date of birth, gender, race, and ethnicity) must be managed to support unique patient identification, reporting, care provision requirements. Patient Demographic information may also include information about the patient's contacts, methods of contact (e.g., email or telephone), and modes of contact (e.g., call secretary during the day, send text message on the weekend). Patient demographic data are captured and maintained as discrete fields and may be enumerated, numeric, or codified according to scope of practice, organizational policy, and/or jurisdictional law. Key patient identifiers (i.e., name and primary patient record identifier) often appear on patient information output (e.g., rendering of a patient's record). Patients may have multiple, and/or compound names, sometimes employing accent marks or special characters. To help parse patient names, discrete fields are often used.

| | cip parse patient names, discote neids are often used. | | | |
|-----|---|-------------|----|-----|
| 1. | The system SHALL provide the ability to capture demographic information as discrete data as part of the patient record. | DC.1.1.2#1 | NC | 644 |
| 2. | The system SHALL provide the ability to maintain demographic information as discrete data as part of the patient record. | DC.1.1.2#2 | NC | 645 |
| 3. | The system SHALL provide the ability to render demographic information as discrete data as part of the patient record. | DC.1.1.2#3 | NC | 646 |
| 4. | The system SHALL provide the ability to manage historic information for demographic data including prior names, addresses, phone numbers and email addresses. | DC.1.1.2#6 | NC | 647 |
| 5. | The system SHALL render a set of patient identifying information at each interaction with the patient record, according to scope of practice, organizational policy, and/or jurisdictional law (e.g., a certain realm may require that the patient's picture appear on every screen that is used during a provider's face-to-face interactions with the patient). | DC.1.1.2#7 | NC | 648 |
| 6. | The system MAY store the demographic information (and other meaningful individual identifiers) separately from clinical data for identity protection purposes. | DC.1.1.2#10 | NC | 649 |
| 7. | The system SHALL provide the ability to capture valid date/time values in discrete fields (e.g., $2011/12/31\ 2330$), including valid incomplete or partial date/time values (e.g., $2011/12$). | | NC | 650 |
| 8. | The system SHOULD provide the ability to enter a partial date/time if the exact date/time of birth or death is unknown (e.g., year/month only). | | NC | 651 |
| 9. | The system SHALL provide the ability to capture the patient's gender used for administrative purposes (as distinct from the clinical gender). | | NC | 652 |
| 10. | The system SHOULD provide the ability to manage multiple active addresses for the patient. | | NC | 653 |
| 11. | The system SHOULD provide the ability to manage multiple active phone numbers for the patient. | | NC | 654 |
| 12. | The system SHOULD provide the ability to manage the names and contact information of the patient's personal representatives (e.g., guardian, surrogate or financial guarantor) and personal relationships (e.g., foster parents or biological parents). | | NC | 655 |
| 13. | The system SHALL provide the ability to manage the date/time of birth, down to the minute, according to scope of practice, organizational policy, and/or jurisdictional law. | | NC | 656 |
| 14. | The system SHOULD provide the ability to capture patient demographics through integration with hospital systems to facilitate patient registration. | | NC | 657 |
| 15. | The system SHOULD provide the ability for the patient to annotate demographic data. | | NC | 658 |
| 16. | The system SHOULD determine and render a patient's age and age units for any given date. | | NC | 659 |
| 17. | The system MAY analyze and render potential merge matches for registrations according to organizational policy. | | NC | 660 |
| 18. | The system SHALL provide the ability to manage multiple patient names in each name component field (e.g., first, middle, last, suffix, or title). | | NC | 66 |
| 19. | The system SHALL provide the ability to manage patient names that include any accent marks or special characters. | | NC | 662 |
| 20. | The system MAY provide the ability to link family or group members so that information that is common to all the members can be updated. | | NC | 663 |

| Section/Id#: Type: | Header/Function Name Conformance Criteria | Reference | Chg Ind | Row# |
|-----------------------|---|-----------|---------|------|
| CPS.1.3 Function | Capture Quick Registration | | NC | 664 |

Statement: Capture a registration, either directly entered or received from an external system, without complete supporting demographics, in order to facilitate patient care before the full registration is complete.

Description: The registration process, including the verification of full demographics data, insurance, contact information, etc. is frequently time consuming. To facilitate patient care in emergency situations, the system must be able to register a patient with minimal information in a time critical manner. Examples of situations when this might be necessary include when a patient presents with acute myocardial infarction, a disaster response, or a mass casualty event.

After care is given during an emergent situation, records are often incomplete or invalid. Such records may need to be completed and validated. Afterwards, those records may need to be harmonized. For example, the records of "John Doe1; approximate age is 30" may need to be matched with existing records for "Henry Smith; age 28".

| , | SHALL provide the ability to capture patient registration information to accommodate registration situation (e.g., during a disaster or during a census overload at a facility). | NC | 665 |
|---------------------|--|----|-----|
| | SHOULD provide the ability to capture registration through integration with an external Hospital ADT) before all identifying data is known. | NC | 666 |
| | SHALL provide the ability to harmonize information generated during an expedited rocess with the EHR. | NC | 667 |
| CPS.1.4 Function | Capture Referral Request | NC | 668 |

Statement: Enable the receipt and processing of referrals from care providers or healthcare organizations, including clinical and administrative details of the referral, and consents and authorizations for disclosures as required.

Description: Incoming referrals may be from physicians' offices, specialists, clinics, Emergency Medical Services (EMS), transfers from other hospitals or emergency departments, nursing homes, etc. Referrals may be received electronically (i.e. e-Referrals); or may be received non-electronically. If non-electronic, the system needs to allow the user to capture the referral information and manage referral request. If the system supports e-Referrals, then the system will also need to support additional functionality to manage the receipt of the referral request. When a system receives a referral request the request must be validated against established criteria to determine if it meets the recipient's requirements and is appropriate. Referrals may be received for patients who do not previously exist in the recipient system and the system must allow for the ability to triage the request and respond to the requestor. If appropriate the system should allow for the creation of a patient record including the capture of clinical and administrative information received with the referral request. The management of information on patients who are inbound to the care setting is an important component of information management. Data must be easily accessible, centrally retrievable, updatable, transportable and reusable. Clinical data from provider to provider is essential to quality-coordinated care for patients referred to the care setting. Knowledge of patients who are expected to arrive helps both care setting and administrative staff plan resource use in real time.

| 1. | The system SHALL provide the ability to capture referral(s) in some form (e.g., paper, fax, electronic) from other care provider(s), whether internal or external to the organization. | NC | 669 |
|-----|---|----|-----|
| 2. | The system SHALL capture and render the Source of Referral and the Reason for Referral. | NC | 670 |
| 3. | The system SHOULD provide the ability to import or receive a referral(s) from other care provider(s), whether internal or external to the organization. | NC | 671 |
| 4. | The system SHALL conform to function CPS.2.1 (Support externally-sourced Clinical Documents) to support the capture of referral documents. | NC | 672 |
| 5. | The system SHALL conform to function CPS.2.2 (Support externally-sourced Clinical Data) to support the capture of referral data. | NC | 673 |
| 6. | The system SHOULD conform to function CPS.2.3 (Support Emergency Medical System Originated Data) to support the capture of referral data. | NC | 674 |
| 7. | The system SHALL conform to function CPS.2.4 (Support externally-sourced Clinical Images) to support the capture of referral images. | NC | 675 |
| 8. | The system SHALL provide the ability to analyze and present recommendations for potential matches between the patient identified in a received referral and existing patients in the system. | NC | 676 |
| 9. | IF the system provides the ability to electronically capture referrals, THEN the system SHALL provide the ability to receive an e-referral for a patient that did not previously exist in the system. | NC | 677 |
| 10. | IF the system provides the ability to electronically capture referrals, THEN the system SHALL provide the ability to define a minimum set of required information that must be included in an ereferral to be accepted, according to scope of practice, and/or organizational policy. | NC | 678 |
| 11. | The system SHOULD provide the ability to capture administrative details from a referral that was received (e.g., insurance information, or a consent and authorization for disclosure). | NC | 679 |
| 12. | The system SHOULD provide the ability to capture clinical details from a referral that was received. | NC | 680 |
| 13. | IF the system provides the ability to electronically capture referrals, THEN the system SHALL provide the ability to present received e-referrals to a user for triage and approval. | NC | 681 |
| 14. | The system MAY conform to function AS.9.2 (Support Financial Eligibility Verification) and display the results of electronic referral eligibility and health plan/payer checking. | NC | 682 |
| 15. | IF the system provides the ability to electronically capture referrals, THEN the system MAY provide the ability to define diagnosis-based requirements for accepting an e-referral to enable system triage of referrals (e.g., a breast cancer specialist would not want to receive a colon cancer patient referral). | NC | 683 |

| ction/ld#: pe: | | Header/Function Name Conformance Criteria | Reference | Chg Ind | Row# |
|-------------------|-----------------------|--|-----------|---------|------|

| 25. | | provide the ability to transmit to the referring provider a notification that the patient ppointment with the referred to provider. | | NC | 693 |
| PS.1.5 nction | | Manage Patient Encounter | | NC | 694 |

Description: Each encounter of the patient with the healthcare setting needs to be recorded and the information relevant to the distinct encounter managed. This information includes date and time of the encounter, providers involved, location(s), and the reason for the encounter etc. Additionally, follow-up encounters may require prior administrative and clinical information to be determined or captured, maintained and rendered.

Tele-health encounters have unique requirements that may also be supported by the system.

| | 1. | • | | provide the ability to manage information regarding a patient encounter, n of the following data: the date/time, providers, location, and reason for the | | NC | 695 |

| CPS.1.7.1 Function | Support for Patient and Family Preferences | DC.2.1.4 | NC | 720 |

Statement: Support the integration of patient and family preferences into clinical decision support.

Description: Decision support functions should permit consideration of patient/family preferences and concerns, such as with language, religion, culture, medication choice, invasive testing, and advance directives. Such preferences should be captured in a manner that allows for their integration with the health record and easy retrieval from the health record. Preferences may be specified across all treatment plans or specifically to individual or set of treatment plans. Preferences may also be used to adjust patient information including labeling and medication instructions (e.g., for language and print size).

| CPS.1.7.2 Function | | Manage Patient Advance Directives | DC.1.3.2 | NC | 728 |

Statement: Capture and maintain patient advance directives.

Description: Patient advance directives and provider Do Not Resuscitate (DNR) orders are captured, as well as the date and circumstances under which the directives were received, and the location of any paper or electronic advance directive documentation.

Advanced Directives may include for example living will, durable power of attorney, preferred interventions for known conditions, or the existence of a "Do Not Resuscitate" order.

Circumstances is used to indicate where, how and when an advanced directive was captured (e.g., provided by the patient's parent during initial consultation visit).

| 1. | of directive, relevative which the directive | L provide the ability to manage advance directive information including the type int dates (e.g., received, reviewed, rescinded, updated), circumstances under s were received (e.g., during initial consultation), and the location of any paper nee directive documentation. | DC.1.3.2#8 | NC | 729 |

| CPS.1.7.3 Function | | Manage Consents and Authorizations | DC.1.3.3 | NC | 737 |

Statement: Create, maintain, and verify patient decisions (such as informed consent for treatment or disclosure).

Description: Decisions are documented and include the extent of information, verification levels and exposition of treatment options. This documentation helps ensure that decisions made at the discretion of the patient, family, or other responsible party, govern the actual care that is delivered or withheld. There may be several documents active at any one time that may govern a patient's care. Both clinical and administrative consents and authorizations are considered part of this function. A consent or authorization includes patient authorization for re-disclosure of sensitive information to third parties. Consents/Authorizations for printing should include appropriate standardized forms for patients, guardians, or foster parents. The system must appropriately present forms for adolescents according to privacy rules.

Some jurisdictions may mandate assent. Assent is agreement

by the patient to participate in services when they are legally unable to consent (e.g., an adolescent, an adult with early dementia).

|-----------------------|---|------------|---------|------|
| CPS.2.1 Function | Support externally-sourced Clinical Documents | DC.1.1.3.1 | NC | 755 |

Statement: Incorporate clinical documentation (computable and scanned) from external (to the system) sources.

Description: Mechanisms for incorporating external clinical documentation (including identification of source) are available. External is considered anything that is external to the system - i.e. documents from the organization; but created in another system would be considered 'external' for the purposes of this function. Documentation incorporated through these mechanisms is presented alongside locally captured documentation and notes wherever appropriate. This covers all types of documents received by the provider that would typically be incorporated into a medical record, including but not limited to faxes, referral authorizations, consultant reports, and patient/resident correspondence of a clinical nature. Intrinsic to the concept of electronic health records is the ability to exchange health information with other providers of health care services. Health information from these external sources needs to be received, stored in the patient record, and displayed upon request.

External data and documents addressed in the function include:

- Laboratory results received through an electronic interface This information is to be received and stored in the resident record as discrete data, which means that each separate element of the data needs to be stored in its own field. Therefore, if laboratory results are received through an electronic interface, the results are received in the EHR and the laboratory test name, result (value), and unit of measure are correctly displayed as discrete data (vs. report format).
- Scanned documents received and stored as images (e.g., power of attorney forms, Living wills) These scanned documents are indexed and can be retrieved based on the document type, date of the original document, and the date of scanning.
- Text-based outside reports (e.g., x-ray reports, hospital discharge summaries, history & physicals) Any mechanism for capturing these reports is addendable: OCR, PDF, image file of report, etc.
- Clinical images from an external source (e.g., radiographic images, digital images from a diagnostic scan or graphical images) These images may be stored within the system or be provided through direct linkage to an external source such as a hospital PACS system.
- Other forms of clinical results, such as wave files of EKG tracings.
- Medication detail (e.g., a medication history) from an external source such as a pharmacy, the patient, payer, or another provider While the medication detail includes the medication name, strength, and SIG, this does not imply that the data will populate the medication module.
- Structured, text-based reports (e.g., medical summary text in a structured format).
- Standards-based structured, codified data (e.g., a Continuity of Care Document (CCD) with SNOMED CT).

Data incorporated through these mechanisms is presented alongside locally captured documentation and notes wherever appropriate.

| 1. | The system SHALL provide the ability to capture, store and render external documents. | DC.1.1.3.1#1 | NC | 756 |
|-----|---|---------------|----|-----|
| 2. | The system SHALL provide the ability to capture, store and render scanned documents. | DC.1.1.3.1#4 | NC | 757 |
| 3. | The system SHOULD provide the ability to capture, store and render computable documents (e.g., CDA, ISO 13606, laboratory results or medication lists). | DC.1.1.3.1#2 | NC | 758 |
| 4. | The system SHOULD provide the ability to store imaged documents or link to the imaged documents in imaging systems. | DC.1.1.3.1#5 | NC | 759 |
| 5. | The system SHALL provide the ability to receive from an external source unstructured, text-based documents and reports. | DC.1.1.3.1#6 | NC | 760 |
| 6. | The system SHOULD provide the ability to receive from an external source structured, text-based documents and reports. | DC.1.1.3.1#10 | NC | 761 |
| 7. | The system SHALL provide the ability to uniquely tag and render scanned documents based on the document type, the date of the original document and the date of scanning according to scope of practice, organizational policy, and/or jurisdictional law. | | NC | 762 |
| 8. | The system SHALL provide the ability to link documentation and annotations with structured content (e.g., link information gathered during an office visit, phone communication, or e-mail consult with structured content that is stored as a laboratory result, problem, or diagnosis). | | NC | 763 |
| 9. | The system SHOULD conform to function TI.1.5 (Non-Repudiation) and TI.1.6 (Secure Data Exchange) when importing/receiving both structured and unstructured data. | | NC | 764 |
| 10. | The system MAY provide the ability to render a notification or alert based on information received from an external source according to scope of practice, organizational policy, and/or jurisdictional law. | | NC | 765 |
| 11. | IF a system receives information from external sources, THEN the system SHALL be able to identify the source of that information. | | NC | 766 |

| Section/ld#: Type: | Header/Function Name Conformance Criteria | Reference | Chg Ind | Row# |
|-----------------------|---|-----------|---------|------|
| CPS.2.2 Function | Support externally-sourced Clinical Data | | NC | 767 |

Statement: Incorporate discrete clinical data from external sources and support communication/presentation of data captured from medical and non-medical devices and entities.

Description: Mechanisms for incorporating external clinical data (including identification of source) are available and communication with non-medical devices and entities is supported as appropriate to the care setting such as an office or a patient's home. Externally-sourced data may be presented with locally-sourced documentation and notes wherever appropriate. This covers all types of data received by the provider that would typically be incorporated into a medical record, including but not limited to faxes, referral authorizations, consultant reports, and patient/resident correspondence of a clinical nature. Intrinsic to the concept of electronic health records is the ability to exchange health information with other providers of health care services. Health information from these external sources needs to be received, stored in the patient record, and displayed upon request.

Examples of externally-sourced data and documents include:

- Laboratory results received through an electronic interface.

This information is received and stored in the resident record as discrete data, which means that each separate element of the data needs to be stored in its own field. Therefore, if laboratory results are received through an electronic interface, the results are received in the EHR and the laboratory test name, result (value), and unit of measure are correctly displayed as discrete data (instead of in report or summarized format).

- Scanned documents received and stored as images (e.g., power of attorney forms or living wills).

These scanned documents are indexed and can be retrieved, e.g., based on the document type, date of the original document, and the date of scanning.

- Text-based outside reports (e.g., x-ray reports, hospital discharge summaries or history and physical examinations).

Any mechanism for capturing these reports is acceptable (e.g., OCR, PDF, JPG or TIFF).

- Clinical images from an external source (e.g., radiographic images, digital images from a diagnostic scan or graphical images).

These images may be stored within the system or be available by direct linkage to an external source (e.g., a hospital's picture archiving and communication system).

- Other forms of clinical results (e.g., EKG waveforms).
- Medication history from an external source such as a retail pharmacy, the patient, or another provider .

While the medication history includes the medication name, strength, and SIG, this does not imply that the data will populate the medication administration module. In many systems the medication administration module is populated from the medication order rather than from the medication history.

- Structured, text-based reports (e.g., medical summary text in a structured format).
- Standards-based structured, codified data (such as a standards-based referral letter that contains SNOMED CT codes).

Such data may be presented with locally-sourced documentation and notes wherever appropriate.

| | 1. | | L provide the ability to capture and store computable data (e.g., laboratory or medication details). | | NC | 768 |

| CPS.2.3 Function | | _ | Support Emergency Medical System Originated Data | | NC | 776 |

Statement: Provide the ability to capture and maintain patient information from an external Emergency Medical System (EMS).

Description: Emergency Medical Systems can provide care at the patient's location, prior to transport, or while enroute to medical facilities via ambulance, aeromedical evacuation and other transport mechanisms. Key parts of information about the patient can be gathered here, some of which is computable data (e.g., EKG and other telemetry), non-computable text-based and multimedia digital objects (e.g., images, audio reports and conversations).

| 1 | 1. The system SHOULD provide the ability to capture and store information transmitted from the Emergency Medical Services (EMS) (e.g., wound site, nature of the wound, vital signs). | | | | 777 |
| 2 | . The system MAY p Service. | provide the ability to capture and store an audio file from an Emergency Medical | | NC | 778 |
| CPS.2.4 Function | | Support externally-sourced Clinical Images | | NC | 779 |

Statement: Incorporate clinical images from external sources and support communication/presentation of images from medical and non-medical devices and entities.

Description: Mechanisms for incorporating external clinical images (including identification of source) are available and communication with non-medical devices and entities is supported as appropriate to the care setting such as an office or a patient's home. Externally-sourced images may be presented with locally-sourced documentation and notes wherever appropriate. This covers all types of images received by the provider that would typically be incorporated into a medical record. These image documents are indexed and can be retrieved, e.g., based on the document type, date of the original document, and the date of scanning. Images may also be stored within the system or accessed by reference to an external system (e.g., a hospital's picture archiving and communication system). Examples of image formats include OCR, PDF, JPG or TIFF.

Examples of externally-sourced images include:

- laboratory results report images
- Radiographic images
- Images of power of attorney forms, living wills or birth certificates
- Graphs and charts
- Photographs or drawings of patient wounds
- Wave files of EKG tracings

| | ra | diographs, pictui | ULD provide the ability to capture, store and render clinical images (e.g., res, video/audio, waveforms) received from external sources. | | | 780 |
|---------------------|--|-------------------|--|------------|----|-----|
| | 2. The system SHOULD provide the ability to receive from an external source clinical result images (e.g., radiologic images). | | | | NC | 781 |
| | The system SHOULD provide the ability to receive from an external source other forms of clinical results (e.g., wave files of EKG tracings or psychological assessment results). | | | | NC | 782 |
| CPS.2.5 Function | | | Support patient-originated Data | DC.1.1.3.2 | NC | 783 |

Statement: Capture and explicitly label patient-originated data, link the data source with the data, and support provider authentication for inclusion in patient health record.

Description: It is critically important to be able to distinguish clinically authored and authenticated data from patient-originated data that is either provided by the patient for inclusion in the EHR or entered directly into the EHR by the patient from clinically authenticated data. Patients may provide data for entry into the health record or be given a mechanism for entering this data directly. Patient-originated data intended for use by providers will be available for their use.

Data about the patient may be appropriately provided by:

- the patient;
- a surrogate (e.g., parent, spouse, guardian);
- an informant (e.g., teacher, lawyer, case worker); or
- devices (e.g., blood pressure/sugar monitors).

An electronic health record may provide the ability for direct data entry by any of these. Patient-originated data may also be captured by devices and transmitted for inclusion into the electronic health record.

Data entered by any of these must be stored with source information. A provider must authenticate patient-originated data included in the patient's legal health record. A provider must be able to indicate they have verified the accuracy of patient-originated data (when appropriate and when a verification source is available) for inclusion in the patient record.

Such verification does not have to occur at each individual data field and can be at a higher level of the data.

| 1. | The system SHALL capture the source of clinical data provided on behalf of the patient and tag the data accordingly. | DC.1.1.3.2#3 | NC | 784 |
|----|--|--------------|----|-----|
| 2. | The system SHALL provide the ability for an authorized user (e.g., clinician) to tag as accurate and verified patient-originated data (when appropriate and when a verification source is available) for inclusion in the patient record (e.g., patient-originated allergy report is verified by clinician so that it may appear in the allergy list). | DC.1.1.3.2#5 | NC | 785 |
| 3. | The system SHALL capture patient-sourced data distinctly from provider-sourced data (i.e. ensure that provider sourced data is not modified by patient-sourced data). | DC.1.1.3.2#9 | NC | 786 |
| 4. | The system SHALL capture both structured and unstructured data as defined in RI.1.2.1 (Manage Record Entries). | | NC | 787 |
| 5. | The system SHOULD provide the ability to send notifications to consumer health solutions, such as Personal Health Records (PHRs) or home monitoring devices. | | NC | 788 |

| CPS.2.6 Function | Support Patient Health Data Derived from Administrative and Financial Data and Documentation | DC.1.1.3.3 | NC | 790 |

Statement: Capture and explicitly label patient health data derived from administrative or financial data; and link the data source with that data.

Description: It is critically important to be able to distinguish patient health data derived from administrative or financial data from clinically authenticated data.

| The system SHALL provide the ability to capture, store and render patient health data derived from administrative or financial data and tag it as such. | | | | | 791 |
|---|--|---|--------------|----|-----|
| The system SHOULD provide the ability to capture, store, and render, the source of patient health data derived from administrative and financial data. | | | DC.1.1.3.3#2 | NC | 792 |
| | The system SHOULD provide the ability to annotate patient health information derived from administrative or financial data (e.g., by providing text-based comments, attaching a picture of an injury, or attaching an image of a supporting document). | | | NC | 793 |
| CPS.2.7 Function | | Support Patient Data Derived from Eligibility, Formulary and Benefit Documentation for Electronic Prescribing | | NC | 794 |

Statement: Capture and explicitly label patient data derived from eligibility, formulary and benefit information; and link the data source with that data.

Description: Sources of eligibility, formulary and benefit may provide data for entry into the electronic prescribing or be given a mechanism for entering this data directly. The data must be explicitly labeled as derived from eligibility, formulary and benefit information. Patient data that is derived from eligibility, formulary and benefit data may be provided by:

- a provider
- a payer, or
- entities that transmit or process eligibility, formulary and benefit data

| 1 | 1. The system SHALL provide the ability to manage patient data derived from eligibility, formulary and benefit information. | | | 795 |

| CPS.3 Header | | | Support Clinical Documentation | | NC | 805 |
| | | | | | | |

Statement: Standard assessments, guidelines and prompts are provided to facilitate decision support for the optimization of patient care based on specific medical conditions.

Description: Provider support is offered for the consideration of issues that would help assure optimal patient management. These may include standard assessments, care plans and treatment protocols, with triggers and prompts to assist during the patient encounter. Recommendation for patient testing and follow-up is also included along with decision support for patient self-management of a condition between patient-provider encounters.

| Section/Id#: Type: | Header/Function Name Conformance Criteria | Reference | Chg Ind | Row# |
|-----------------------|---|-----------|---------|------|
| CPS.3.1 Function | Support for Standard Assessments | DC.2.1.1 | NC | 806 |

Statement: Support the establishment, updates and use of assessment forms that will assist in the development of and adherence to care plans, guidelines, and protocols at the point of information capture.

Description: As part of managing assessment definitions, the system will support the ability to create a set of assessment forms and, optionally, associated logic (e.g., workflow, business and clinical rules). This assessment definition process may include the ability to define, revise and manage the tools, files and processing for the conduct of a patient assessment. Furthermore, the assessment definition may also include template development, prompts for additional information, related notification alerts and workflow processes. When a clinician fills out an assessment, data entered triggers the system to prompt the assessor to consider issues that would help assure a complete/accurate assessment. A simple demographic value or presenting problem (or combination) could provide a template for data gathering that represents best practice in this situation, e.g., Type 2 (Adult Onset) Diabetes diabetic review, fall and 70+, and rectal bleeding. Support for standard assessment may include the ability to record and store the value for the answers to specific questions in standardized assessment tools or questionnaires. When a specific recognized-standard assessment does not exist, the system will support the creation of unique new, locally-defined assessment. The system may enable, and/or encourage the use of the format and data elements of similar assessments in the systems whenever possible. (NOTE: A new assessment may not necessarily be unique, since a facility may copy an assessment from another facility.)

| CPS.3.2 Function | Support for Patient Context- Driven Assessments | DC.2.1.2 | NC | 815 |

Statement: Offer prompts based on patient-specific data at the point of information capture for assessment purposes.

Description: When a clinician fills out an assessment, data entered is matched against data already in the system to identify potential linkages and optimize patient care. For example, the system could scan the medication list and the knowledge base to see if any of the symptoms are side effects of medication already prescribed. Important diagnoses could be brought to the doctor's attention, for instance ectopic pregnancy in a woman of child bearing age, or appendicitis in a geriatric patient who has abdominal pain.

| The system SHOULD provide the ability to analyze assessment data entered during the encounter against health evidence based standards and best practices. | DC.2.1.2#2 | NC | 816 |
|---|------------|----|-----|

|-----------------------|--|------------|---------|------|
| CPS.3.3 Function | Support for Standard Care Plans, Guidelines, Protocols | DC.2.2.1.1 | NC | 824 |

Statement: Support the use of appropriate standard care plans, guidelines, protocols, and/or clinical pathways for the management of specific conditions.

Description: A core capability of Clinical Decision Support is that of providing guidelines, plans and protocols to clinicians. These templates or forms can be specific for populations, medical conditions or individual patients. Before they can be used in care provision standard care plans, guidelines, protocols, and clinical pathways must be created. These templates or forms may reside within the system or be provided through links to external sources, and can be modified and used on a site specific basis. To facilitate retrospective decision support, variances from standard care plans, guidelines, protocols and clinical pathways can be identified and reported.

| CPS.3.4 Function | Support for Context-Sensitive Care Plans, Guidelines, Protocols | DC.2.2.1.2 | NC | 839 |
|---------------------|---|--------------|----|-----|
| | The system SHOULD capture research protocol deviation information, including any verbatim text of protocol deviation. | | NC | 838 |
| | The system SHOULD tag specific missing elements/sections of incomplete records. | | NC | 837 |
| 13. | The system SHOULD provide the ability to render an indicator that a patient record is incomplete (e.g., not finalized or authenticated/signed) when a discharge or transfer order is entered into the system. | | NC | 836 |
| 12. | The system SHOULD provide the ability to tag and render an indicator that a patient record is incomplete (e.g., not finalized or authenticated/signed). | | NC | 835 |

| | The system SHOULD conform to function POP.4 (Support for Monitoring Response Notifications Regarding a Specific Patient's Health). | | NC | 829 |
| 4. | The system SHOULD determine variances from standard care plans, guidelines and protocols for reportable conditions and provide the ability to capture, maintain and transmit related information to public health. | | NC | 828 |
| 3. | The system SHOULD determine variances from standard care plans, guidelines, protocols, and clinical pathways and provide the ability to capture, maintain and render appropriate alerts, notifications and reports. | DC.2.2.1.1#4 | NC | 827 |
| 2. | The system SHOULD provide the ability to maintain site-specific modifications to standard care plans, guidelines, protocols, and clinical pathways obtained from outside sources. | DC.2.2.1.1#3 | NC | 826 |
| | The system SHOULD provide the ability to capture and maintain site-specific care plans, guidelines, protocols, and clinical pathways. | | NC | 825 |

Statement: Identify and present the appropriate care plans, guidelines, protocols, and/or clinical pathways for the management of patient-specific conditions that are identified in a patient clinical encounter.

Description: At the time of the clinical encounter (problem identification), recommendations for tests, treatments, medications, immunizations, referrals and evaluations are presented based on evaluation of patient-specific data such as age, gender, developmental stage, their health profile, and any site-specific considerations. These may be modified on the basis of new clinical data at subsequent encounters.

| 1. | The system SHALL provide the ability to render care and treatment plans that are sensitive to the context of patient data and assessments. | DC.2.2.1.2#1 | NC | 840 |
|----|--|--------------|----|-----|
| 2. | The system SHOULD provide the ability to capture and maintain the choice of action in response to care plan suggestions. | DC.2.2.1.2#4 | NC | 841 |
| 3. | The system SHOULD identify, track and provide alerts, notifications and reports about variances from standard care plans, guidelines, protocols and clinical pathways. | DC.2.2.1.2#5 | NC | 842 |
| 4. | The system SHALL conform to function CPS.3.1 (Support for Standard Assessments). | DC.2.2.1.2#7 | NC | 843 |

| CPS.3.9 Function | Clinical Decision Support System Guidelines Updates | S.3.7.1 | NC | 873 |

Statement: Capture and maintain updates of clinical decision support system guidelines and associated reference material.

Description: System content such as discharge instructions, clinical guidelines, formularies, and other knowledge bases should be capable of being maintained and updated, independent of a particular encounter. Clinical decision support rules may be applied to the system using a manual process. As standards are developed to represent these rules, an automated update will be recommended. Any process to update decision support rules should include the verification of the appropriateness of the rules to the system. This may include but not be limited to authenticity of the source, the currency of the version, and any necessary approvals before updates can take place.

| The system SHALL provide the ability to maintain the clinical content or rules utilized to generate clinical decision support reminders and alerts. | | | S.3.7.1#1 | NC | 874 |

| CPS.3.10 Function | | Support for Identification of Potential Problems and Trends | DC.2.1.3 | NC | 877 |

Statement: Identify conditions of clinical interest, identify trends that may lead to significant problems, and provide prompts for clinical decision support.

Description: Providing the health care provider with a prompt, notification or alert for identified specific concerns of clinical interest is a cornerstone of Clinical Decision Support. When personal health information is collected directly during a patient visit, input by the patient, or acquired from an external source (laboratory results), it is important to be able to identify and tag potential problems and trends that may be condition- or patient-specific (given the individual's personal health profile), or changes warranting further assessment.

|-----------------------|---|-----------|---------|------|
| CPS.3.11 Function | Support Other Encounter and Episode of Care Documentation | S.3.1.5 | NC | 896 |

Statement: Where not covered above, provide the means to manage and organize the documentation of the health care needed and delivered during an encounter/episode of care.

Description: Using data standards and technologies that support interoperability, effective documentation of an encounter can promote patient- centered/oriented care and enables real-time, immediate point-of-service care delivery. Effective encounter and episode-of-care documentation can facilitate efficient work flow and improve operations performance. This can help to ensure the integrity of (1) the health record, (2) public health, financial and administrative reporting, and (3) the healthcare delivery process.

| 1. | The system SHAL admissions and ep | L provide the ability to render patient data by encounter, including previous isodes of care. | S.3.1.5#1 | NC | 897 |
|----------------------|---|--|-----------|----|-----|
| 2. | • | JLD provide the ability to capture and annotate patient encounter data from such as diagnostic tests and reports. | S.3.1.5#2 | NC | 898 |
| 3. | following input met forms, pick lists or | L provide the ability to capture encounter documentation by one or more of the chods: - direct keyboard entry of text; - structured data entry utilizing templates, macro substitution; and- dictation with subsequent transcription of voice to text, via voice recognition system. | S.3.1.5#3 | NC | 899 |
| 4. | | JLD provide the ability to capture and maintain presentation filters that are es of encounter (e.g., care provider specialty, location of encounter, date of ated diagnosis). | S.3.1.5#4 | NC | 900 |
| CPS.3.12 Function | | Manage Health Information Record Quality | | NC | 901 |

Statement: Support grammatical and lexical integrity of the health record by providing medical spelling, thesaurus and grammar ready assistance during clinical documentation as well as enabling shortcuts for pre-defined text.

Description: Users and patients will benefit from features that enable rapid checking of spelling and grammar, a medical thesaurus function as well as text shortcuts to expand pre-defined text during clinical documentation. A shortcut may also be defined to trigger a specific system function such as the opening of a pre-defined template. These functions may be defined at an enterprise level based on scope of practice, organizational policy, and/or jurisdictional law. However, pre-defined text may also be configured by provider or provider type.

| | • | JLD determine and present the correct medical spelling based on an integrated cal spelling function. | NC | 902 |

| CPS.4 Header | | - Support Orders | NC | 911 |

Statement: Support for Orders is required to ensure that appropriate decision support and safety checks are conducted by the system at the time of ordering as well as at the time of dispensing medications or immunizations.

Description: Support for orders includes the management of order set templates, the support for specific types of orders including medication, immunization, non-medication, diagnostic tests as well as blood products and biologicals.

Decision Support for orders includes checking for allergies or adverse interactions, dosing checking and issuing the appropriate warnings. It may also include functions to increase ordering efficiency such as verifying all necessary information to fulfill the order is captured and making recommendations for supporting orders.

A component of ordering medications and immunizations is the dispensing of those orders and, where applicable, this function will include criteria to support dispensing. Note: Administration of Orders is included in CPS.6 (Support for Treatment Administration).

| Section/Id#: Type: | Header/Function Name Conformance Criteria | Reference | Chg Ind | Row# |
|-----------------------|---|-----------|---------|------|
| CPS.4.1 Function | Manage Order Set Templates | DC.2.4.1 | NC | 915 |

Statement: Maintain order set templates based on preferred standards, provider preferences, organizational policy or other criteria.

Description: Order set templates, which may include medication orders, allow a care provider to choose common orders for a particular circumstance or disease state according to standards (e.g., best practice guidelines) or other criteria. Order Set Templates may be defined to allow or not allow the provider to modify (add/remove/update) specific orders when applying them to a specific patient.

| defir | ned to allow or not allow the provider to modify (add/remove/update) specific orders when applying | them to a spe | cific patient. | |
|---------------------|---|---------------|----------------|-----|
| 1. | The system SHALL provide the ability to manage order set templates, including creation from provider input and version control. | DC.2.4.1#1 | NC | 916 |
| 2. | The system MAY capture an order set template based on a specific patient's orders/data according to scope of practice, organizational policy, and/or jurisdictional law. | DC.2.4.1#4 | NC | 917 |
| 3. | The system SHOULD provide the ability to manage order set templates created for conditions or diseases. | DC.2.4.1#5 | NC | 918 |
| 4. | The system MAY provide the ability to capture the practice standards or criteria used to create order set templates (e.g., as a note attached to the template). | DC.2.4.1#7 | NC | 919 |
| 5. | The system MAY render order set templates to providers based on diagnoses, conditions, or symptoms to aid decision support. | DC.2.4.1#8 | NC | 920 |
| 6. | The system SHALL conform to function CP.4.1 (Use Order Sets). | DC.2.4.1#9 | NC | 921 |
| 7. | The system SHOULD provide the ability to capture and maintain an order set template containing all order types relevant to a particular problem (e.g., laboratory , radiology, medications, nursing tasks, and materials management). | | NC | 922 |
| 8. | The system SHOULD capture, maintain and render order set templates customized by patient age, sex, or other patient factors. | | NC | 923 |
| 9. | The system SHOULD capture, maintain and render order set templates customized by provider type. | | NC | 924 |
| 10. | The system MAY capture, maintain and render order set templates customized by provider. | | NC | 925 |
| 11. | The system SHOULD capture, maintain and render standing order set templates for triage or for specific conditions. | | NC | 926 |
| 12. | The system MAY provide the ability to manage links or access to applicable clinical standards and reference materials within an order set. | | NC | 927 |
| 13. | The system SHOULD provide the ability to capture, maintain and render the date that an order set was last modified. | | NC | 928 |
| 14. | The system SHOULD provide the ability to capture, maintain and render order set templates that are pre-configured with order entry information. | | NC | 929 |
| 15. | The system SHOULD provide the ability to capture, maintain and render multiple choices of orders within an order set template for clinician selection. | | NC | 930 |
| 16. | The system SHOULD provide the ability to capture, maintain and render text instructions or recommendations within order sets. | | NC | 931 |
| 17. | The system SHALL provide the ability to capture a name for an order set. | | NC | 932 |
| 18. | The system SHALL provide the ability to render order set(s) by name. | | NC | 933 |
| 19. | The system SHALL provide the ability to render orders in the same manner regardless of the manner in which they were ordered (individually or from within an order set). | | NC | 934 |
| 20. | The system SHOULD provide the ability to integrate order sets within other order sets. | | NC | 935 |
| 21. | The system SHALL determine and render drug-drug interaction and drug-allergy reaction checking to orders placed through an order set in the same way as orders placed individually. | | NC | 936 |
| 22. | The system MAY provide the ability to render reports on the use of order sets, including such data as orders, ordering provider, date/time ordered, basic patient data (e.g., demographics), and condition(s) being treated. | | NC | 937 |
| 23. | The system SHALL provide the ability to capture, maintain and render order sets that allow or disallow individual orders to be selected or deselected by the user (e.g., standing orders that can't be modified during care provision). | | NC | 938 |
| | The system MAY provide the ability to capture and maintain order set preferences. | | NC | 939 |
| CPS.4.2 Function | Support for Medication and Immunization Ordering | DC.2.3.1 | NC | 940 |

Statement: Provide functionality to alert providers to potential medication and immunization ordering errors (such as wrong patient, wrong drug, wrong dose, wrong route and wrong time).

Description: During medication or immunization ordering it is critical to minimize potential errors that can cause adverse events. This is accomplished by the EHR system through the use of clinical decision support and prompting to validate the order at time of ordering. Whist many of these functions are more commonly associated with medication ordering; they also apply to ordering of immunizations when such ordering occurs. The support includes the checking for drug/drug interactions, checking against documented allergies or previous adverse events as well as validating patient-specific dosing and providing appropriate warnings. support for medial ordering efficiencies also ensures that orders are appropriate and contain all required supporting information.

| 1. | The system SHALL provide the ability to maintain a discrete list of orderable medications and | DC 1 7 1#5 | NC | 941 |
|----|---|------------|-----|-----|
| | immunizations (i.e., formulary). | 50.1.7.170 | ''' | 0 |

| Section/Id#: Type: | Header/Function Name Conformance Criteria | Reference | Chg Ind | Row# |
|-----------------------|---|---------------|---------|------|
| 2. | The system SHOULD provide the ability to render a paper copy of medication and immunization prescriptions for the patient to take to a pharmacy for fulfillment. | | NC | 942 |
| 3. | The system SHOULD provide the ability to render electronic medication and immunization prescriptions to a pharmacy. | | NC | 943 |
| 4. | The system SHOULD provide the ability to render an alert or notification that a non-formulary medication or immunization was ordered according to scope of practice, organizational policy, and/ or jurisdictional law. | NC | 944 | |
| 5. | The system SHOULD provide the ability to exchange medication and immunization orders with an external medication management system. | | NC | 945 |
| 6. | The system SHOULD update a patient's medication list to show that the medication is discontinued when a prescribed medication or standing medication order is discontinued. | | NC | 946 |
| 7. | The system SHOULD provide the ability to manage specific formularies according to scope of practice, organizational policy, and/or jurisdictional law. | | NC | 947 |
| 8. | The system SHALL provide the ability to maintain directly or by reference a list (i.e. formulary) of medications and immunizations which includes a unique identifier for each medication / immunization. | | NC | 948 |
| 9. | The system MAY provide the ability to capture the duration of a drug interaction warning after the prescription has run-out. | | NC | 949 |
| 10. | The system SHOULD provide the ability to capture and maintain the severity level at which warnings are displayed. | OC.2.3.1.1#11 | NC | 950 |
| 11. | The system SHOULD provide the ability to capture, maintain and render appropriate responses to severity levels at which warnings are displayed. | NC | 951 | |
| CPS.4.2.1 Function | Support for Medication Interaction and Allergy Checking | DC.2.3.1.1 | NC | 952 |

Statement: Identify medication interaction warnings at the time of medication or immunization ordering, or prescribing, as well as at the time of dispensing.

Description: The clinician is alerted to medication-medication, medication-allergy, medication-food, medication-supplement (herbal or dietary) interactions at levels appropriate to the health care setting and with respect to the patient condition. These alerts may be customized to suit the user or group.

Note, medication may be affected by food or diatary choices; whist this is not considered an interaction it is consequently not included in this function; however, the provision of drug-food effectiveness in information to be provided to the patient is included in the function CP.8.1 (Generate, Record and Distribute Patient-Specific Instructions). If the patient's condition is one where, in order to view the necessary components of the health record, patient authorization or consent is required; then the system should show the

medication but mask the condition for which the medication is prescribed until the required consent or authorization is available. In an emergent situation, where all health information is required to provide the most effective treatment, and it is not possible to obtain an authorization or consent; the system should provide an override (e.g., "break the glass") function to allow access to the diagnosis or problem for which a medication was ordered, according to scope of practice, organizational policies, and/or jurisdictional law.

| 1. | The system SHALL determine and present the presence of interactions between medications ordered and medications already on the current medication list. | DC.2.3.1.1#1 | NC | 953 |
|-----|---|---------------|----|-----|
| 2. | The system SHALL determine and present the presence of interactions between medications ordered and true-allergies on the current allergy list. | DC.2.3.1.1#2 | NC | 954 |
| 3. | The system SHOULD determine and present the presence of contraindications between medications ordered and patient's current health condition and characteristics (e.g., gender, age, weight, smoking status, pregnancy status, renal function). | DC.2.3.1.1#11 | NC | 955 |
| 4. | The system MAY determine and present the presence of interactions between medications ordered and ingestibles (e.g., food or beverages). | DC.2.3.1.1#8 | NC | 956 |
| 5. | The system MAY determine and render the presence of interactions between medications ordered, medications on the current medication list as well as previous medications according to organization policy, and/or jurisdictional law. | | NC | 957 |
| 6. | The system SHOULD determine and present the presence of interactions between medications ordered and supplements (i.e. herbal or dietary) on the current medication list. | | NC | 958 |
| 7. | The system SHALL provide the ability to capture, maintain and render a medication order despite alerts for interactions, and/or allergies being present. | DC.2.3.1.1#4 | NC | 959 |
| 8. | The system SHOULD provide the ability to determine and present the presence of duplicate therapies. | DC.2.3.1.1#6 | NC | 960 |
| 9. | The system SHALL conform to function CPS.3.8 (Manage Documentation of Clinician Response to Decision Support Prompts) and provide the ability to document why a drug interaction warning was overridden. | DC.2.3.1.1#7 | NC | 961 |
| | The system SHOULD determine the presence of drug-laboratory interactions and present information to the clinician that certain laboratory test results may be impacted by a patient's medications. | DC.2.3.1.1#9 | NC | 962 |
| 11. | The system SHOULD provide the ability to determine, maintain, and present medications noted to be ineffective for the patient in the past. | DC.2.3.1.1#10 | NC | 963 |
| | | | | |

| Section/Id#: Type: | Header/Function Name Conformance Criteria | Reference | Chg Ind | Row# |
|-----------------------|--|-----------------------------------|-----------------------------------|----------------|
| 12. | The system SHALL provide the ability to present, on demand, potential medication-allergy, medication-medication and medication-condition interactions based on current medications, active allergies and active problems lists. | | NC | 964 |
| 13. | The system SHOULD present the rationale for a medication interaction alert. | | NC | 965 |
| 14. | The system SHALL conform to function CP.1.3 (Manage Medication List) in order to maintain a coded list of medications for the patient (including a unique identifier for each medication). | | NC | 966 |
| 15. | The system MAY render an alert to the user if the medication interaction information or database has not been updated within a set time parameter. | | NC | 967 |
| | The system SHOULD determine and render notifications regarding drug-drug interaction(s) to the patient's provider or to the patient's care team when relevant clinical information changes (e.g., new clinical data from an internal or external source) according to scope of practice, organizational policy, and/or jurisdictional law. | | NC | 968 |
| CPS.4.2.2 Function | Support for patient-specific Dosing and Warnings | DC.2.3.1.2 | NC | 969 |
| of m Des | tement: Identify and present appropriate dose recommendations based on known patient condition nedication ordering and dispensing. cription: The clinician is alerted to patient-specific contraindications and warnings e.g., pregnancy s, hepatic or renal insufficiency. The preferences of the patient may also be presented (e.g., reluctancent parameters, such as age, gestation, genetic disposition, height, weight, and Body Surface Area (Body Surface Area) | , breast-feedir e to use an an | ng or occupat tibiotic). Addit | ional ional |
| 1. | The system SHALL determine and render contraindications to the ordered dosage range. | DC.2.3.1.2#2 | NC | 970 |
| 2. | The system SHOULD determine and render an appropriate medication dosage range, specific for each known patient condition (e.g., diagnosis, pregnancy) and parameter (e.g., height, weight, pulse). | DC.2.3.1.2#1 | NC | 971 |
| | the pharmacy. | DC.2.3.1.2#5 | | 972 |
| 4. | IF the maximum daily doses are known, THEN the system SHALL present the maximum dose per day in dosing decision support. | DC.2.3.1.2#7 | NC | 973 |
| 5. | The system SHOULD provide the ability to determine and render medication dose by patient body weight. | | NC | 974 |
| 6. | The system SHOULD provide the ability to determine and render medication dose by body surface area. | | NC | 975 |
| 7. | The system SHOULD provide the ability to determine and render medication dose_recommendations based on patient parameters, including age and diagnostic test results. | C.2.3.1.12#1 | 4 NC | 976 |
| | The system MAY determine when no recommended medication dosing is available that is specific to known patient conditions and parameters, such as age or weight, and render notifications to the provider. | | | 977 |
| | The system SHOULD determine whether no recommended pediatric medication dosing is available and render notifications to the provider according to scope of practice. | | | 978 |
| | The system SHOULD determine and render medication dosages using all components of a combination medication (e.g., acetaminophen-hydrocodone). | | | 979 |
| | The system SHOULD provide the ability to capture the factors used to calculate the future dose for a given prescription. | | | 980 |
| | The system SHALL determine whether data required to compute a dose are missing or invalid and render notifications to the provider. | | NC NC | 981 |
| | IF the system determines a value that affects medication dosing recommendations (e.g., creatinine clearance), THEN the system SHOULD maintain the formula used for the calculation. | DC.2.3.1.2#21 | NC | 982 |
| 14. | IF the system supports electronic communication with the pharmacy system, THEN the system SHOULD provide the ability to transmit the documented reasons for overriding a medication alert. | | NC | 983 |
| | The system SHOULD provide the ability to determine and maintain the cumulative drug dose. | | NC | 984 |
| | The system SHOULD determine and render a notification if the cumulative medication dose exceeds the recommended dose. | | NC | 985 |
| | The system SHOULD provide the ability to maintain and uniquely render medications with look- alike names with recommended conventions (e.g., from FDA or Institute for Safe Medication Practices), such as, "Tall Man lettering". | | NC | 986 |
| 18. | The system SHOULD provide the ability to determine the presence of medication interactions when multiple medications of the same therapeutic or pharmacologic class are ordered and present notifications when such medications are selected during prescribing/ordering. | | NC | 987 |
| 19. | The system SHOULD provide the ability to determine and render recommended medication for substitution based on availability, cost, generic equivalent, and according to organizational policy, and/or jurisditional law. | | NC | 988 |
| 20. | The system SHALL provide the ability to capture, store and render information concerning medication orders including any alerts following screening of medication orders and the clinician responses (place, modify or cancel order). | | NC | 989 |

| Section/Id#: Type: | Header/Function Name Conformance Criteria | Reference | Chg Ind | Row# |
|-----------------------|--|-----------|---------|------|
| 21. | The system SHOULD provide the ability to capture and render medication warnings and recommendations from official governmental agencies (e.g., FDA, regional centers). | | NC | 990 |
| 22. | The system SHOULD provide the ability to extract reference information for prescribing/warning (e.g., FDA warnings in the US realm). | | NC | 991 |
| 23. | The system MAY provide the ability to store configuration parameters (e.g., coefficients, exponents, formulas) regarding the patient's body surface area. | | NC | 992 |
| CPS.4.2.3 Function | Support for Medication Ordering Efficiencies | | NC | 993 |

Statement: Provide the tooling necessary to support efficient medication ordering.

Description: Support efficient medication ordering workflows by allowing medications to be sorted and reviewed by key attributes, e.g., generic or trade names. Also support editing medication orders across multiple instances of an order and capturing medication orders in order sets.

| 1. | | JLD present a medication compendia or formulary content (e.g., drug, dose, facilitate the selection of the medication to be ordered. | DC.1.7.1#7 | NC | 994 |

| 4. | The system SHOULD determine and render recommendations for monitoring (e.g., labs behaviors, adverse reactions, side effects) as appropriate to a particular medication. | | | NC | 1006 |
| CPS.4.2.5 Function | | Support for Medication Reconciliation | | NC | 1007 |

Statement: Review a patient's medication information (from more than one source) and reconcile conflicts.

Description: Medication reconciliation is the process of comparing a patient's medication information (from all sources) to the medications that the patient is actually has been taking. Medication reconciliation is done to avoid medication errors such as omissions, duplications, dosing errors, or drug interactions. Medication Reconciliation should be done at every episode or transition of care in which new medications are ordered or administered, existing orders are rewritten or where medications may influence the care given.

Transitions in care include changes in setting, service, practitioner, or level of care. The Medication Reconciliation process includes several steps:

- (1) develop a list of current medication list of medications that the patient is taking,
- (2) develop a list of medications to be prescribed or recommended
- (3) compare the medication information from all sources;
- (4) make shared and informed clinical decisions based on the comparison and provide the ability to document the interaction; and
- (5) communicate the updated medication information to the healthcare teams, the patient and appropriate caregivers.

For example: If a patient's pain, anticoagulation, hyperglycemia or other high risk therapy is being managed by a specialist, the healthcare team must be aware to avoid prescribing an additional equivalent of this medication.

- (6) Verify the patient's/caregiver's understanding and agreement to the patient's medication treatment plan.
- (7) Standardization of shared medication information (name, dose, instructions, indications, prescriber, etc)

| CPS.4.6 Header | | Support for Referrals | DC.2.4.4 | NC | 1024 |

Description: The system assists with patient referrals, including prompting the provider with referral recommendations based on the patient's medical record. When creating the referral order, support is provided in the compilation of relevant clinical and behavioral health results, demographic and insurance information (if available). Standardized or evidence based protocols for workup prior to referral may also be presented.

| CPS.4.6.1 | Support for Referral Process | DC.2.4.4.1 | NC | 1025 |
|-----------|------------------------------|------------|-----|------|
| Function | Support for Neierral Process | DC.2.4.4.1 | INC | 1023 |

Statement: Evaluate referrals within the context of a patient's healthcare data.

Description: The system assists with patient referrals, including compilation of relevant clinical and behavioral health results, demographic and insurance information (if available). Standardized or evidence based protocols for workup prior to referral may also be presented.

1. The system SHALL provide the ability to capture and render clinical and administrative data (e.g., insurance information) as part of the referral process.

| CPS.7 Header | | Support Future Care | DC.2.7 | NC | 1102 |

Statement: Support for Future Care is necessary to enable the planning of future care according to appropriate healthcare guidelines.

Description: Support for future care includes the provision of clinical decision support through giving access to healthcare guidelines from external sources.

CPS.7.1 Access Healthcare Guidance DC.2.7.1 NC 1103

Statement: Provide pertinent information from available evidence-based knowledge, at the point of care, for use in healthcare decisions and care planning.

Description: The information available regarding disease, disease processes, diagnostic testing, pharmaceuticals, treatment patterns and all aspects of healthcare is constantly changing. The practitioner should be able to access a wide variety of sources that provide relevant, accurate information about any given subject. Examples of resources include, but are not limited to evidence on treatment of specific medical conditions, maintenance of wellness, drug or device trials, context-specific information available through online journals, printed resources such as books and specialty organizations resources. For example, when a condition is diagnosed the provider might be directed to relevant resources that give updated clinical research, useful pharmaceutical combinations, surgical techniques, products or other information useful in the management of the specific condition under consideration.

| CPS.8.3 Function | Patient Reminder Information Updates | S.3.7.3 | NC | 1121 |

Statement: Receive and validate formatted inbound communications to facilitate updating of patient reminder information from external sources such as Cancer or Immunization Registries.

Description: Information from outside groups, such as immunization groups, public health organizations, etc. may periodically send updates to patient care providers. The system should be capable of generating patient reminders based on the recommendations of these organizations. Patient reminders could be provided to patients by a number of means including phone calls, or mail. A record of such reminders may become part of a patient's record. Examples of reminders could include a recommended immunization, prophylactic guidelines for MVP, patient self-testing for disease, etc.

| CPS.8.4 Function | | Support for Communications Between Provider and Patient, and/or the Patient Representative | DC.3.2.3 | NC | 1128 |

Statement: Facilitate communications between providers and patients, and/or the patient representatives.

Description: Providers are able to communicate with patients and others, capturing as specified by the business rules the nature and content of electronic communication, or the time and details of other communication.

Examples:

- When test results arrive, the clinician may wish to email the patient that test result was normal (details of this communication are captured).
- A patient may wish to request a refill of medication by emailing the physician.
- Patients with asthma may wish to communicate their peak flow logs/diaries to their provider.
- Hospital may wish to communicate with selected patients about a new smoking cessation program.
- Automated notification regarding annual flu shots

| 1. | The system SHALL provide the ability to capture and store documentation of communications between providers and patients and/ or the patient representatives. | DC.3.2.3#1 | NC | 1129 |

| CPS.9 Header | Support Care Coordination & Reporting | | NC | 1162 |

Statement: Support exchange and reporting of information between participants in patient-centered care.

Description: Provide the support necessary to ensure that appropriate communication between providers is possible to coordinate the patient's care including, clinical communication between providers, standard and ad-hoc reporting and information views of the patient record.

| CPS.9.1 | Clinical Communication Management and Support | DC.3.2 | NC | 1163 |
|----------|---|--------|-----|------|
| Function | Chilical Communication Management and Cupport | DO.3.2 | 140 | 1100 |

Statement: Support exchange of information between participants in patient-centered care as needed, and the appropriate documentation of such exchanges. Support secure communication to protect the privacy of information as required by jurisdictional law.

Description: Healthcare requires secure communications among various participant in the patient's circle of care: patients, doctors, nurses, chronic disease care managers, public health authorities, pharmacies, laboratories, payers, consultants etc. An effective EHRS supports communication across all relevant participants, reduces the overhead and costs of healthcare-related communications, and provides automatic tracking and reporting. The list of communication participants is determined by the care setting and may change over time.

Because of concerns about scalability of the specification over time, communication participants for all care settings or across care settings are not enumerated here because it would limit the possibilities available to each care setting and implementation. However, communication between providers and between patients and providers will be supported in all appropriate care settings and across care settings. Implementation of the EHRS enables new and more effective channels of communication, significantly improving efficiency and patient care. The communication functions of the EHRS changes the way participants collaborate and distribute the work of patient care.

| | The system SHOU automatically or m | LD provide the ability to receive and transmit secure real-time messaging either anually. | | NC | 1164 |
|---------------------|--|---|----------|----|------|
| | The system MAY provide the ability to render workflow tasks as part of communication to the provider. | | | NC | 1165 |

| | 4. The system SHOULD have the ability to transmit a notification to the user when a message has been received from an external source. | | | NC | 1167 |
| CPS.9.2 Function | | Support for Inter-Provider Communication | DC.3.2.1 | NC | 1168 |

Statement: Support exchange of information between providers as part of the patient care process, and the appropriate documentation of such exchanges. Support secure communication to protect the privacy of information as required by jurisdictional law.

Description: Communication among providers involved in the care process can range from real time communication (for example, communication between a therapist and nurse), to asynchronous communication (e.g., consult reports between physicians). Some forms of inter-practitioner communication will be paper based and the EHR-S must be able to produce appropriate documents.

The system should provide for both verbal and written communication. These exchanges would include but not be limited to consults, and referrals as well as possible exchanges within the office as part of the provision and administration of patient care (e.g., the communication of new information obtained within the office environment during the process of administration of a tetanus shot while the patient is in the exam room). The system should support the creation and acceptance of paper artifacts where appropriate.

| 1. | The system SHALL provide the ability to capture and store in the patient record verbal/telephone communication (including verbal orders) between providers including the identification of these providers. | DC.3.2.1#1 | NC | 1169 |
|----|---|------------|----|------|
| 2. | The system SHALL provide the ability to integrate scanned documents from providers into the patient record. | DC.3.2.1#2 | NC | 1170 |

|-----------------------|--|-----------|---------|------|
| CPS.9.2.3 Function | Support for Provider -Pharmacy Communication | DC.3.2.2 | NC | 1196 |

Statement: Provide features to enable secure bi-directional communication of information electronically between practitioners and pharmacies or between practitioner and intended recipient of pharmacy orders.

Description: When a medication is prescribed, the order is routed to the pharmacy or other intended recipient of pharmacy orders. This information is used to avoid transcription errors and facilitate detection of potential adverse reactions. If there is a question from the pharmacy, that communication can be presented to the provider with their other tasks. In certain environments, medication order creation is a collaborative process involving the prescriber and facility staff. Accordingly, this function applies to communication process between the prescriber, facility and the pharmacy or other intended recipient of pharmacy orders. The transmission of prescription data between systems should conform to realm acceptable messaging standards. Informative examples:

- HL7 Clinical Document Architecture Release 2
- ISO/EN 13606 Electronic Health Record Communication
- CEN ENV 13607:2000. Health informatics. Messages for the exchange of information on medicine prescriptions
- X12N healthcare transactions
- US realm: National Council for Prescription Drug Programs (NCPDP)
- Canadian realm: National Electronic Claims Standard (NeCST)

| CPS.9.3 Function | | Health Record Output | S.2.2.1 | NC | 1207 |

Statement: Support the definition of the formal health record, a partial record for referral purposes, or sets of records for other necessary disclosure purposes.

Description: Provide hardcopy and electronic output that fully chronicles the healthcare process, supports selection of specific sections of the health record, and allows healthcare organizations to define the report, and/or documents that will comprise the formal health record for disclosure purposes. A mechanism should be provided for both chronological and specified record element output. This may include defined reporting groups (i.e. print sets). For example Print Set A = Patient Demographics, History & Physical, Consultation Reports, and Discharge Summaries. Print Set B = all information created by one caregiver. Print Set C = all information from a specified encounter. An auditable record of these requests and associated exports may be maintained by the system. This record could be implemented in any way that would allow the who, what, why and when of a request and export to be recoverable for review. The system has the capability of providing a report or accounting of disclosures by patient that meets in accordance with scope of practice, organizational policy, and jurisdictional law.

| The system SHALL provide the ability to render reports consisting of all and part of an individual patient's record according to scope of practice, organizational policy, and/or jurisdictional law. | S.2.2.1#1 | NC | 1208 |
|---|-----------|----|------|
| 2. The system SHOULD provide the ability to capture and maintain the records or reports that are considered the formal health record for disclosure purposes. | S.2.2.1#2 | NC | 1209 |
| The system SHOULD provide the ability to render reports in both chronological and specified record elements order. | S.2.2.1#3 | NC | 1210 |
| 4. The system SHOULD provide the ability to maintain and render hardcopy and electronic report summary information (e.g., demographics, procedures, medications, labs, immunizations, allergies, vital signs). | S.2.2.1#4 | NC | 1211 |
| The system MAY provide the ability to capture and maintain reporting groups (i.e., print sets) for specific types of disclosure or information sharing. | S.2.2.1#5 | NC | 1212 |

| Section/Id#: Type: | Header/Function Name Conformance Criteria | Reference | Chg Ind | Row# |
|--|---|-----------|---------|------|
| 6. The system SHALL provide the ability to render patient identifying information on each page of reports (i.e., hard copy and electronic) according to organizational policy, and/or jurisdictional law. | | | NC | 1213 |
| 7. | The system SHOULD provide the ability to update reports to match mandated formats. | S.2.2.1#7 | NC | 1214 |
| 8. | The system MAY provide the ability to render a report that includes metadata for disclosure purposes (e.g., point of record exchange). | | NC | 1215 |
| 9. | The system SHALL provide the ability to manage-data-visibility [hide or redact] (remove from view and/or output) data elements or portions of a report to prevent a given recipient from seeing certain data according to organizational policy, and/or jurisdictional law. | | NC | 1216 |
| 10. | The system SHOULD provide the ability to capture and render [cite] the reasons for redaction. | | NC | 1217 |
| 11. | The system MAY provide the ability to render [reproduce] a copy of the redacted document/record (e.g., through rules, storing a copy). | | NC | 1218 |
| 12. | The system MAY provide the ability to render patient care events sorted or configured by date and time ranges and data/record type. | | NC | 1219 |
| 13. | The system MAY provide the ability to maintain a record of disclosure/release that includes the recipient and outbound content. | | NC | 1220 |
| 14. | 14. The system SHOULD provide the ability to render wrist bands that include appropriate demographic and clinical information. 15. The system SHOULD provide the ability to render a record summary using the format specified by an organization to which a patient is transferred. | | NC | 1221 |
| 15. | | | NC | 1222 |
| CPS.9.4 Function | Standard Report Generation | S.2.2.2 | NC | 1223 |

Statement: Provide report generation features using tools internal or external to the system, for the generation of standard reports.

Description: Providers and administrators need access to data in the EHR-S for clinical, administrative, financial decision-making, audit trail and metadata reporting, as well as to create reports for patients. Many systems may use internal or external reporting tools to accomplish this. Reports may be based on structured data, and/or unstructured text from the patient's health record.

Users need to be able to sort, and/or filter reports. For example:

-the user may wish to view only the diabetic patients on a report listing patients and diagnoses-the user may wish to view only male patients over 35 with a complaint of chest pain.

| 1. | The system SHOULD provide the ability to render reports of structured clinical and administrative data using either internal or external reporting tools. | S.2.2.2#1 | NC | 1224 |
|----|--|-----------|----|------|
| 2 | The system MAY provide the ability to extract unstructured clinical and administrative data for inclusion in the report generation process, using internal or external tools. | S.2.2.2#2 | NC | 1225 |
| 3 | The system SHOULD provide the ability to extract and transmit reports generated. | S.2.2.2#3 | NC | 1226 |
| 4 | The system SHOULD provide the ability to capture and maintain report parameters, based on patient demographic, and/or clinical data, which would allow sorting, and/or filtering of the data. | S.2.2.2#4 | NC | 1227 |
| 5 | The system MAY provide the ability to save report parameters for generating subsequent reports either as integrated component of the system, or an external application, using data from the system. | S.2.2.2#5 | NC | 1228 |
| 6 | The system MAY provide the ability to edit one or more parameters of a saved report specification when generating a report using that specification either as an integrated component of the system, or an external application, using data from the system. | S.2.2.2#6 | NC | 1229 |
| 7 | The system SHOULD provide the ability to render automated reports as required by industry and regulatory bodies. | | NC | 1230 |
| 8 | The system SHOULD provide the ability to extract facility level data at an organizational level in support of organizational initiatives. | | NC | 1231 |
| 9 | The system MAY provide the ability to render a cumulative directory of all personnel who use or access the data. | | NC | 1232 |

| CPS.9.5 Function | Ad Hoc Query and Rendering | S.2.2.3 | NC | 1233 |

Statement: Provide support for ad hoc query and report generation using tools internal or external to the system. Present customized views and summarized information from a patient's comprehensive EHR subject to jurisdictional laws and organizational policies related to privacy and confidentiality. The view may be arranged chronologically, by problem, or other parameters, and may be filtered or sorted.

Description: Providers and administrators need to respond quickly to new requirements for data measurement and analysis. This may be as a result of new regulatory requirements or internal requirements. This requires that users be able to define their own query parameters and retain them. The data may be found in both structured and unstructured data. Providers and administrators also need to query for the absence of specific clinical or administrative data. For example, the Quality Control department may be reviewing whether or not the protocol for management of Diabetes Mellitus is being followed. If the protocol calls for fasting blood sugars every 3 months at minimum, the investigator might need to run an across-patient query locating patients with diabetes who do not show an FBS result within the last 3 months. Emergency Department benchmarking reports - Key point of time include arrival time; treatment area entrance time, MD contact time; decision to admit, discharge or transfer time; and departure (left ED) time. Important intervals include, but are not limited to the "door to doctor time", "doctor to diction time", "admission to bed availability or departure" as well as overall length of stayA key feature of an electronic health record is its ability to support the delivery of care by enabling prior information to be found and meaningfully displayed. EHR systems should facilitate search, filtering (e.g., filtering by key word, tagged data, or diagnosis), summarization, and presentation of available data needed for patient care. Systems should enable views to be customized, for example, specific data may be organized chronologically, by clinical category, by consultant, depending on need. The views may be arranged chronologically, by problem, or other parameters, and may be filtered or sorted. Jurisdictional laws and organizational policies that prohibit certain users from accessing certain patient information must be supported.

| 1. | • | JLD provide the ability to render ad hoc query and reports of structured clinical data through either internal or external reporting tools. | S.2.2.3#1 | NC | 1234 |

4. Administration Support Section

Section Overview

The Administrative Support Section focuses on functions required in the EHR-S to support the management of the clinical practice and to assist with the administrative and financial operations. This includes management of resources, workflow and communication with patients and providers as well as the management of non-clinical administrative information on patients and providers. All functions within the Administrative Support Section have an identifier starting with "AS".

| AS.1.4 Function | Manage Provider's Location(s) or Office(s) | S.1.3.4 | NC | 1404 |

Statement: Provide locations or facility contact information for the provider in order to direct patients or queries.

Description: Providers may have multiple locations or offices where they practice. The system should maintain information on the primary location, any secondary locations, as well as the scheduled hours at each location. Information maintained may include web sites, maps, office locations, etc.

| The system SHOULD manage information necessary to identify primary and secondary practice locations or offices of providers. | | S.1.3.4#1 | NC | 1405 |
|--|---|-----------|----|------|
| The system SHOULD contain the information on times of service availability at primary and secondary locations or offices of providers. | | | NC | 1406 |
| AS.1.5 Function | Team/Group of Providers Registry or Directory | S.1.3.5 | NC | 1407 |

Statement: Provide access to a current directory, registry or repository of information on teams or groups of providers according to scope of practice, organizational policy, and/or jurisdictional law.

Description: An organization may assign caregivers to teams that need to be registered as such. In another scenario, an organization might contract with a group of providers. The group would be listed by the group name or individually or both. A caregiver might be part of more than one team or group. All of these factors need to be supported. Information includes, but is not limited to: full name, address or physical location, and a 24x7 telecommunications address (e.g., a phone or pager access number).

| 2. The system SHOULD provide the ability for authorized users to manage the assignment of providers to appropriate teams or groups of providers according to scope of practice, organizational policy, and/or jurisdictional law. 3. The system MAY provide the ability to determine the identity of a provider's employer(s) for administrative or financial purposes through the use of internal, and/or external registry services or directories. 4. The system SHALL provide the ability to tag the role of each provider associated with a patient (e.g., encounter provider, primary care provider, attending, resident, or consultant) 5. The system SHOULD provide the ability to manage care team membership. 6. The system SHOULD provide the ability to manage demographic and scheduling information on care team members, according to scope of practice, organizational policy, and/or jurisdictional law. | | | | | | |

| Provider Caseload/Panel S 1 3 6 NC 1 | | | | | NC | 1413 |
| | | | Provider Caseload/Panel | S.1.3.6 | NC | 1414 |

Statement: Provide access to a provider's caseload or panel information.

Description: An organization might employ the concept of caseload or panel of patients to facilitate continuity of care and distribution of work. A caregiver may have, or be accountable for, one or more defined caseloads or panels of members/patient/clients within the organization. Information about a caseload or panel may include an indication that an opening is available on a certain caseload or an indication that a certain patient is not suitable for that caseload. A member/patient may be provided access to a listing of caregivers with open caseloads or panels to select a provider.

| The system SHAL according to scope | S.1.3.6#1 | NC | 1415 | |
|--|---|-------|------|------|
| 2. The system SHOULD conform to function AS.1.7 (Manage Practitioner/Patient Relationships). | | | NC | 1416 |
| AS.1.7 Function | Manage Practitioner/Patient Relationships | S.3.4 | NC | 1417 |

Statement: Identify relationships among providers treating a single patient, and provide the ability to manage patient lists assigned to a particular provider.

Description: This function addresses the ability to manage current information about the relationships between providers and the patients. This information should be able to flow seamlessly between the different components of the system, and between the EHR system and other systems. Business rules may be reflected in the presentation of, and the access to this information. The relationship among providers treating a single patient will include any necessary chain of authority/responsibility.

Example

-In a care setting with multiple providers, where the patient can only see certain kinds of providers (or an individual provider); allow the selection of only the appropriate providers.

-The user is presented with a list of people assigned to a given practitioner and may alter the assignment as required to a group, to another individual

or by sharing the assignment.

| 1. The system SHALL provide the ability to extract the information needed to identify all providers by name associated with a specific patient encounter. | S.3.4#1 | NC | 1418 | |

| 7. The system MAY provide the ability to capture data-validation rules for patient demographic data according to scope of practice, organizational policy, and/or jurisdictional law (e.g., synchronization of a patient's records where the values for the patient's sex are Male="1" in one record, and Male="m" in another record, can only be accomplished if the data-validation rules for those values in each record are known). | | | S.1.4.1#4 | NC | 1439 |
| AS.2.2 Function | | Manage Patient's Location Within Facility | S.1.4.2 | NC | 1440 |

Statement: Provide the patient's location information within a facility's premises.

Description: It is important to maintain, and/or provide access to information regarding the patient's location within a facility during an episode of care. This information can be as simple as the identification of the patient's bed assignment (e.g., John Doe1, Bed 3, Ward 2). It is also important to provide real-time information regarding the patient's location since they may receive ancillary services in multiple parts of the facility (e.g., in the physical therapy or diagnostic imaging departments). Note: The patient's location within a facility may also be revealed by viewing standard reports (such as an Emergency Department Log). The system should support viewing a patient's specific location in terms that may include campus, building, wing, unit, room, and/or bed. The system should support jurisdictional laws related to the patient's ability (or desire) to consent to disclose their location within a facility (e.g., it may be unlawful to require a minor child to sign a consent form regarding their location in a facility). The patient's location information within the facility should also be available even before the patient is ascribed to a specific provider within that facility. As such, the system may need to provide a query feature regarding the patient's location information. The system may also support the identification of the patient by alternate identifying names (e.g., John Doe1 or "J. Doe1"). For example, the patient's physical therapist may be permitted to view an elderly patient's location within a long term care facility, but the patient's pharmacist may be restricted from viewing that information.

| 1. | 1. The system SHALL provide the ability to render information regarding the patient's assigned location when the patient has an assigned location (e.g., specific bed). | | | 1441 |
|---|---|---------|----|------|
| The system SHOULD provide the ability to render information regarding a patient's location based on existing patient-consent documentation and according to scope of practice, organizational policy, and/or jurisdictional laws. | | | NC | 1442 |
| 3. | The system MAY provide the ability to manage information regarding the patient's current location (e.g., temporary location of patient). | | | 1443 |
| 5. | The system MAY provide the ability to render information regarding the patient's current location by alternate identifiers (e.g., by arrival number, by alias, or by bed-number). | | NC | 1445 |
| 6 | The system MAY render the de-identified list of patients who have not consented to release of information. | | | 1446 |
| The system SHOULD provide the ability to render an alert if the patient has exceeded a system- defined time in a location. | | | NC | 1447 |
| AS.2.3 Function | Manage Patient's Residence for the Provision and Administration of Services | S.1.4.3 | NC | 1448 |

Statement: Provide the patient's residence information for the provision and administration of services to the patient, patient transport, and as required for public health reporting.

Description: This function is intended to support the provision of services to patients at their place of residence. Examples include but are not limited to the following:

- -Visiting nurse may be providing care to a new mother and baby at their place of residence.
- -A patient with a mobility problem may require transport to and from a clinic appointment.
- -Support identification of multiple residences for a patient like a child with multiple guardians (divorced parents with joint custody) or adults with Winter/Summer residences.

| The system SHOULD provide the ability to manage the patient's primary residence or place of habitation (e.g., home address or homeless shelter). | S.1.4.3#1 | NC | 1449 |
|--|-----------|----|------|
| 2. The system SHOULD provide the ability to manage the patient's secondary or alternate residence. | S.1.4.3#2 | NC | 1450 |
| 3. The system MAY provide the ability to manage patient information related to the provision of service (e.g., ambulance transport or home health care services). | S.1.4.3#3 | NC | 1451 |
| The system SHOULD provide the ability to manage patient information related to transport, such as, mobility status and special needs. (e.g., wheelchair, walker) | S.1.4.3#4 | NC | 1452 |

| Section/Id#: Type: | Header/Function Name Conformance Criteria | Reference | Chg Ind | Row# |
|-----------------------|--|-----------|---------|------|
| AS.4.3 Function | Support for Communications Between Organizations | | NC | 1511 |

Statement: Facilitate communications regarding patient orders, data and status between organizations.

Description: There needs to be an ability to communicate patient data and status (e.g., patient history, patient physical examination), discrete clinical data (e.g., blood pressure, pulse, temperature, pulse oximetry, laboratory data, microbiology data, radiology data), and orders(e.g., medications, tests) between health care organizations, particularly during patient transfers.

This information may include items such as outstanding patient requests, clinician care recommendations, and outstanding treatment and workflow tasks for the patient. Organizations can include both health care providing organizations (e.g., hospitals, nursing homes) and non-health care providing organizations (e.g., funeral homes, disaster operations, employers).

| The system SHOULD provide the ability to render patient transfer information to other health care organizations (e.g., hospitals, clinics, specialists, nursing homes) according to scope of practice, organizational policy, and/or jurisdictional law. | | | NC | 1512 |
|--|--|--|----|------|
| The system MAY provide the ability to render selected patient transfer information to non-health care organizations (e.g., funeral home) according to scope of practice, organizational policy, and/ or jurisdictional law. | | | NC | 1513 |
| AS.4.4 Function | Support for Provider-Employer Communications | | NC | 1514 |

Statement: Provide support for capturing employment information, and/or special work related requirements (e.g., flyers, divers, firemen, transportation workers) to assist in medical disposition choices and notifications, and support communication to employers.

Description: The ability to capture and maintain a patient's employment information, to include contact information and job title, which is expected to be helpful to the clinician when a patient's work environment may affect the assessment of alternative diagnoses, applicable to the individual, as well as the potential treatment(s) that have been tailored to the individual based on their occupation.

| | The system MAY provide the ability to capture patient's employment data relevant to potential medical conditions. | | | NC | 1515 |
|--|---|----------------------------------|--------|----|------|
| | 2. The system MAY provide the ability to capture data used to determine if a patient is able to fulfill physical job requirements and/ or special work requirements as part of their medical disposition. | | | NC | 1516 |
| The system MAY provide the ability to manage reporting to employers on a patient's ability to fulfill physical or special job requirements as a result of their medical disposition. | | | | NC | 1517 |
| AS.5 Header | | Manage Clinical Workflow Tasking | DC.3.1 | NC | 1518 |

Statement: Create, schedule, update and manage tasks with appropriate timeliness.

Description: Since an electronic health record will replace the paper chart or other paper-based system, tasks that were based on the paper artifact must be effectively managed in the electronic environment. Functions must exist in the EHR-S that support electronically any workflow that previously depended on the existence of a physical artifact (such as the paper chart, a phone message slip) in a paper based system. Tasks differ from other more generic communication among participants in the care process because they are a call to action and target completion of a specific workflow in the context of a patient's health record (including a specific component of the record). Tasks also require disposition (final resolution). The initiator may optionally require a response.

For example, in a paper based system, physically placing charts in piles for review creates a physical queue of tasks related to those charts. This queue of tasks (for example, a set of patient phone calls to be returned) must be supported electronically so that the list (of patients to be called) is visible to the appropriate user or role for disposition. The state transition (e.g., created, performed and resolved) may be managed by the user explicitly or automatically based on rules. For example, if a user has a task to signoff on a test result, that task should automatically be marked complete by the EHR when the test result linked to the task is signed in the system. Patients will become more involved in the care process by receiving tasks related to their care.

| AS.5.1 | Clinical Task Creation, Assignment and Routing | DC.3.1.1 | NC | 1510 |
|----------|---|----------|-----|------|
| Function | Chillical Task Creation, Assignment and Rodding | DC.3.1.1 | INC | 1319 |

Statement: Creation, assignment, delegation, and/or transmission of tasks to the appropriate parties.

Description: A "Task" is a specific piece of work or duty that is assigned to a person or entity. A task often needs to be accomplished within a defined period of time or by a deadline. Tasks are often managed by an activity (or project) tracking mechanism (e.g., as part of an automated business rule process). Tasks are determined by the specific needs of patients and practitioners in a care setting. Task creation may be automated, where appropriate. An example of a system-triggered task is when laboratory results are received electronically; a task to review the result is automatically generated and assigned to a responsible party. Tasks are at all times assigned to at least one user or role for disposition. Whether the task is assignable and to whom the task can be assigned will be determined by the specific needs of practitioners in a care setting.

Task-assignment lists help users prioritize and complete assigned tasks. For example, after receiving communication (e.g., a phone call or e-mail) from a patient, the triage nurse routes or assigns a task to return the patient's call to the physician who is on call physician. Another example is for a urinalysis, the nurse routes or assigns a task to clinical staff to collect a urine specimen, and for the results to be routed to the responsible physician and person ordering the test. Task creation and assignment may be automated, where appropriate. An example is when (International Normalized Ratio) INR results are received they should be automatically routed and assigned to the staff person in the clinic responsible for managing all of the patients that are having INR tests done. Task assignment ensures that all tasks are disposed of by the appropriate person or role and allows efficient interaction of entities in the care process. When a task is assigned to more than one individual or role, an indication is required to show whether the task must be completed by all individuals/roles or if only one completion suffice.

| 1. The system SHALL provide the ability to capture new tasks. | DC.3.1.1#1 | NC | 1520 |

| 4. | The system SHOULD provide the ability to capture oral (e.g., telephone, voice-over-IP or inperson) communication between providers and patients or their representatives (including the identification of the providers). | | NC | 1523 |
| 5. | The system SHALL provide the ability to determine and update an assignment for a task to one or more individuals or clinical roles, based on workflow rules. | | NC | 1524 |
| 6. | The system SHOULD provide the ability to determine workflow task routing to individuals or roles in succession or in parallel. | DC.3.1.1#6 | NC | 1525 |
| 7. | The system SHOULD provide the ability to determine workflow task routing to multiple individuals or roles in succession or in parallel based on status and workflow rules. | | NC | 1526 |
| 8. | The system SHOULD provide the ability to capture and update priorities for tasks. | DC.3.1.1#7 | NC | 1527 |
| 9. | The system SHOULD provide the ability to determine and update priorities for tasks (e.g., based on urgency assigned to the task, clinical rules and business rules). | | NC | 1528 |
| 10. | The system SHOULD provide the ability to capture restrictions for task assignment based on an appropriate role according to organizational policy. | DC.3.1.1#8 | NC | 1529 |
| 11. | The system SHOULD determine restrictions for task assignment based on appropriate role according to organizational policy. | | NC | 1530 |
| 12. | The system SHALL provide the ability to update the priorities of clinical tasks (e.g., to ensure timely completion). | DC.3.1.1#9 | NC | 1531 |
| 13. | The system SHOULD determine and update the priorities of clinical tasks according to organizational policy (e.g., to ensure timely completion). | | NC | 1532 |
| 14. | The system SHOULD provide the ability to transmit task assignment with request for confirmation to external systems that participate in completion of the task (e.g., task requesting patient transportation OR request for meeting between providers). | | NC | 1533 |
| 15. | The system SHOULD provide the ability to render a list of tasks by user or user role according to user specified criteria. | | NC | 1534 |
| 16. | The system SHOULD provide the ability to determine time periods and recipients for notification of overdue medication administrations. | | NC | 1535 |
| 17. | The system SHOULD provide the ability to render a notification to the clinician of overdue medication administrations. | | NC | 1536 |
| 18. | The system SHOULD provide the ability to determine time periods for order expiration for types of orders. | | NC | 1537 |
| 19. | The system SHOULD provide the ability to render a notification to the ordering clinician concerning orders due to expire. | | NC | 1538 |
| 20. | The system SHOULD provide the ability to render a notification to the ordering clinician concerning orders requiring signature (e.g., verbal and telephone orders, co-signature). | | NC | 1539 |
| 21. | The system SHOULD provide the ability to enter and maintain the clinical task assignments and pre-conditions expected for performance of identified/selected health care procedures according to scope of practice, organizational policy, and/or jurisdictional law. | | NC | 1540 |
| 22. | The system SHOULD provide the ability to reassign a single task or group of tasks to available roles when primary role selected is not available. | | NC | 1541 |
| | IF the system determines that applicable tasks and pre-conditions expected have not been performed, THEN the system SHOULD transmit a notification to a patient's provider or to the patient's care team according to scope of practice, organizational policy, and/or jurisdictional law. | | NC | 1542 |
| AS.5.2 Function | Clinical Task Assignment and Routing for Medication Management & Administration | | NC | 1543 |

Statement: Assignment, delegation, and/or transmission of tasks for Medication Orders and Prescription Management.

Description: There are tasks that are specific to prescription management. An example of a system-triggered task is when a medication defined as for continuous use runs out, a notification task should be initiated for evaluation of the need to renew or not. Quality care implies consideration of medication continuation or renewal in light of various patient and visit factors. This requires also that the relevant information is presented to the clinician in an effective manner. The decision by the clinician must then be captured in an efficient manner and actioned by the system through task assignment and communication. Presentation of tasks to be carried out needs to be in a manner that facilitates their execution and management and needs to correspond to user preferences. For example, the list could be ordered by priority or by pharmacy phone number for efficiency.

| The system SHOULD provide the ability for the user to enter set rules for being notified about medication continuation, and/or renewal for specific patients. | NC | 1544 |
|--|----|------|
| The system SHOULD provide the ability to determine and render cases for which the clinician needs to evaluate the need for renewal of a medication, given the specific rules set for the patient, and patient profile, visit history, current medication and treatments. | NC | 1545 |
| The system SHOULD present relevant information on the patient to facilitate decision on medication continuation or renewal. | NC | 1546 |

| Section/Id#: Type: | Header/Function Name Conformance Criteria | Reference | Chg Ind | Row# |
|-----------------------|--|-----------|---------|------|
| , | The system SHALL provide the ability to determine the tasks to be performed in relation to medication continuation or renewal. | | NC | 1547 |
| AS.5.3 Function | Clinical Task Linking | DC.3.1.2 | NC | 1548 |

Statement: Linkage of tasks to EHR components, patients, and/or a relevant part of the electronic health record.

Description: Clinical tasks must include information or provide an electronic link to information that is required to complete the task. There is a need to create the appropriate links and, then, to have the system automatically present the information that was linked. For example, this may include a patient location in a facility, a patient's, and/or family's contact information, or a link to new laboratory results in the patient's EHR. Other example: the linkage of prescription task to the appropriate patient care plan to facilitate follow-up actions; a task to take weights links to the 'Weights and Vitals' screen to record the result; a task to complete a fall assessment links to the fall assessment form to be completed. An example of a well defined task is "Dr. Jones must review Mr. Smith's blood work results." Efficient workflow is facilitated by navigating to the appropriate area of the record to ensure that the appropriate test result for the correct patient is reviewed.

| | 1. | The system SHAL required to comple | L provide the ability to link a clinical task to the component of the EHR system ete the task. | DC.3.1.2#1 | NC | 1549 |

| AS.5.4 Function | | | Clinical Task Status Tracking | DC.3.1.3 | NC | 1553 |

Statement: Track tasks to facilitate monitoring for timely and appropriate completion of each task.

Description: In order to reduce the risk of errors during the care process due to missed tasks, the provider is able to view the status of each task (e.g., unassigned, on hold, started, performed, canceled, denied, and resolved) and current work lists, lists of unassigned tasks or undisposed tasks, or of other tasks where a risk of omission exists. The timeliness of certain tasks can be tracked, or reports generated, in accordance with relevant law and accreditation standards. For example, a provider is able to create a report that shows tests that have not yet been performed such as urine specimen obtained, blood work drawn, etc. Another example is that of an electronic prescribing system that would track when a refill request or prescription change is received, who it has been assigned to, the action performed, and when it was completed.

| S.6 eader | | Manage Resource Availability | | NC | 1569 |

Statement: Manage the availability of healthcare resources to support the provision of care.

Description: Resources may include human resources (e.g., providers, support personnel) as well as physical resources (e.g., facilities, transportation, equipment, supplies). Managing resources includes managing the availability of necessary resources to support the provision of care including resource scheduling and managing information about the resources (e.g., availability, capabilities). The management of resources may also include supporting triage categorization, waiting rooms and patient acuity and severity determination.

|-----------------------|---|-----------|---------|------|
| AS.6.5 | Support Waiting Poom Management | | NC | 1590 |
| Function | Support Waiting Room Management | | NC | 1590 |

Statement: Provide support to waiting room management

Description: An EHR-S should support the reporting, tracking and alerts needed to help managethose patients that need to wait and supporting prioritization decisions by the clinicians who are caring for them.

| 1 | The system SHALL present a list of triaged patients. | | | | 1591 |
|---|---|---|-------|----|------|
| 2. The system SHOULD provide the ability to present triaged patients filtered and sorted simultaneously by multiple criteria, such as provider, ward, triage acuity rating and wait time. | | | | NC | 1592 |
| 5 | 3. The system MAY render an alert when a parameter has been exceeded, such as the number of patients waiting, or the length of wait time. | | | NC | 1593 |
| 4 | 4. The system SHOULD provide the ability to store information about wait times. | | | NC | 1594 |
| AS.6.6 Function | | Support Patient Acuity and Severity Determination | S.3.6 | NC | 1595 |

Statement: Provide the data necessary to support and manage patient acuity and severity determination for illness/risk-based adjustment of resources.

Description: Acuity data helps determine appropriate staffing – as modified by the nurses' level of experience, the organization's characteristics, and the quality of clinical interaction between and among physicians, nurses, and administrators. Research has been done on nurse staffing and patient outcomes; the impact of organizational characteristics on nurse staffing patterns, patient outcomes, and costs; and the impact of nurses' experience on patient outcomes. The research indicates that nurse staffing has a definite and measurable impact on patient outcomes, medical errors, length of stay, nurse turnover, and patient mortality. Also, acuity and severity data is routinely the evidential basis most frequently cited by staff when recommending clinical staffing changes.

| | 1. | • | LD provide the ability to capture (i.e., collect) data to support the patient acuity/ for illness/risk-based adjustment of resources. | S.3.6#1 | NC | 1596 |
|----------------|--|--|---|---------|----|------|
| | 2. The system MAY provide the ability to extract and transmit (i.e., export) data to support the patient acuity/severity processes for illness/risk-based adjustment of resources. | | | S.3.6#2 | NC | 1597 |
| | 3. | The system MAY render a prompt for the user to provide key data needed to support acuity/severity processes. | | S.3.6#3 | NC | 1598 |
| | 4. | The system MAY p | provide the ability to determine patient acuity, and/or severity levels. | | NC | 1599 |
| AS.7 Header | | | Support Encounter/Episode of Care Management | S.3.1 | NC | 1600 |

Statement: Manage and document the health care needed and delivered during an encounter/episode of care.

Description: Using data standards and technologies that support interoperability, encounter management promotes patient-centered/ oriented care and enables real time, immediate point of service, point of care by facilitating efficient work flow and operations performance to ensure the integrity of (1) the health record, (2) public health, financial and administrative reporting, and (3) the healthcare delivery process.

This support is necessary for care provision functionality that relies on providing user interaction and workflows. These interactions and workflows are configured according to clinical protocols and business rules. These protocols and rules are based on encounter specific values such as care setting, encounter type (inpatient, outpatient, home health, etc.), provider type, patient's EHR, health status, demographics, and the initial purpose of the encounter.

| AS.7.1 | Manage Presentation Filters | S 3 1 1 | NC | 1601 | i |
|----------|-------------------------------|---------|-----|------|---|
| Function | Manage i resentation i illers | 3.3.1.1 | INC | 1001 | ĺ |

Statement: Present specialized views based on the encounter-specific values, clinical protocols and business rules.

Description: The system user is presented with a presentation view and system interaction appropriate to the context with capture of encounter-specific values, clinical protocols and business rules. This "user view" may be configurable by the user or system technicians. As an example, a mobile home health care worker using wireless laptop at the patient's home would be presented with a home health care specific workflow synchronized to the current patient's care plan and tailored to support the interventions appropriate for this patient, including chronic disease management protocols.

| The system SHOULD provide the ability to capture and maintain presentation filters that are specific to the types of encounter (e.g., care provider specialty, location of encounter, date of encounter, associated diagnosis). | | NC | 1602 |
|---|-----------|----|------|
| The system MAY provide the ability to capture and maintain presentation filters that are specific to the patient demographics. | S.3.1.1#2 | NC | 1603 |
| The system SHOULD provide the ability to capture and maintain (i.e., tailor) an individual user's "user view". | S.3.1.1#3 | NC | 1604 |

Page: 72

| Section/Id#: Type: | Header/Function Name Conformance Criteria | Reference | Chg Ind | Row# |
|-----------------------|---|-----------|---------|------|
| AS.7.2 Function | Support Encounter Documentation | S.3.1.2 | NC | 1605 |

Statement: Provide assistance in assembling data, supporting data collection and processing output from a specific encounter.

Description: Workflows, based on the encounter management settings, will assist (with triggers alerts and other means) in determining and supportingdata collection, import, export, extraction, linkages and transformation. As an example, a pediatrician is presented with diagnostic and procedure codes specific to pediatrics. Business rules enable automatic collection of data from the patient's health record and patient registry. As the provider enters data, workflow processes are triggered to populate transactions and documents. For example, data entry might populate an eligibility verification transaction or query the immunization registry.

| 1. | 1. The system SHOULD determine and render workflow support for data collection in a care setting. | | | NC | 1606 |
|--------------------|---|-----------------------------|-----------|----|------|
| 2. | 2. The system SHOULD provide the ability to capture and maintain encounter and care setting specific data entry workflows. | | | NC | 1607 |
| 3. | 3. The system SHOULD provide the ability to extract information from the patient record as necessary to support documentation of the patient encounter. | | S.3.1.2#3 | NC | 1608 |
| 4. | The system SHOULD capture and maintain a reduced set of diagnostic and procedure codes for the care setting. | | S.3.1.2#4 | NC | 1609 |
| 5. | The system MAY analyze the information entered into the encounter and, based on business rules, initiate secondary reporting workflows. | | S.3.1.2#5 | NC | 1610 |
| AS.7.3 Function | | Support Financial Reporting | S.3.1.3 | NC | 1611 |

Statement: Provide clinical data to support administrative and financial reporting.

Description: The system may be able to generate or support the creation of a bill based on health record data. Maximizing the extent to which administrative and financial data can be derived or developed from clinical data by the system, will lessen provider reporting burdens and the time it takes to complete administrative and financial processes such as claim reimbursement. This may be implemented by mapping of clinical terminologies in use to administrative and financial terminologies. Administrative and financial systems may be integrated or non-integrated.

| | The system SHOL and financial requi | JLD provide the ability to capture and maintain clinical data for administrative rements. | S.3.1.3#1 | NC | 1612 |
|--------------------|-------------------------------------|--|-----------|----|------|
| | • | JLD export appropriate data in required format to administrative and financial to scope of practice, organizational policy, and/or jurisdictional law. | S.3.1.3#2 | NC | 1613 |
| AS.7.4 Function | | Support Remote Healthcare Services | S.3.1.4 | NC | 1614 |

Statement: Support remote health care services such as tele-health and remote device monitoring by integrating records and data collected by these means into the patient's record for care management, billing and public health reporting purposes.

Description: Enables remote treatment of patients using monitoring devices, and two way communications between provider and patient or provider and provider. Promotes patient empowerment, self-determination and ability to maintain health status in the community. Promotes personal health, wellness and preventative care. For example, a diabetic pregnant mother can self-monitor her condition from her home and use web TV to report to her provider. The same TV-internet connectivity allows her to get dietary and other health promoting information to assist her with managing her high-risk pregnancy.

| 1. The system SHOL that data into the p | ILD provide the ability to capture patient data from remote devices and integrate patient's record. | S.3.1.4#1 | NC | 1615 |
|---|---|-----------|----|------|
| 2. The system MAY | provide the ability to render patient data to remote devices. | S.3.1.4#2 | NC | 1616 |
| AS.7.5 Function | Manage Transitions of Care and Discharged Patients | | NC | 1617 |

Statement: Provide a means to manage outstanding patient issues after the encounter, for transits of care and discharge.

Description: After the completion of an encounter, a number of tasks may remain for discharge planning, patient instructions and transitions of care. There may be outstanding laboratory tests (i.e. blood cultures) radiology interpretations, or other tasks such as arrangement of home health aids (VNA), transportation or calls to the patient's primary care provider during office hours to establish follow-up. There must be a way to track and document these tasks after the conclusion of the encounter.

| The system SHOULD provide the ability to manage post-encounter tasks (e.g., discharge planning, patient instructions, transfer activities). | NC | 1618 |
|---|----|------|
| 2. The system SHOULD provide the ability to tag the patient as a transfer patient (e.g., hospital-to-hospital, birthing facility, and long-term-care-facility to hospital). | NC | 1619 |
| 3. The system MAY provide the ability to link transfer facility demographic information to the transfer patient. | NC | 1620 |
| 4. The system MAY provide the ability to capture the transfer mode of transportation (e.g., ambulance, airplane). | NC | 1621 |
| 5. The system MAY provide the ability to capture transportation provider demographics. | NC | 1622 |

|-----------------------|--|-----------|---------|------|
| AS.8 Header | Manage Information Access for Supplemental Use | S.3.2 | NC | 1623 |

Statement: Support extraction, transformation and linkage of information from structured data and unstructured text in the patient's health record for care management, financial, administrative, and public health purposes.

Description: Information in the patient's health record is used for administrative purposes (e.g., care management, finance and public health services) that are supplemental to care provision and care provision support. Using data standards and technologies that support interoperability, information access functionalities serve primary and secondary record use and reporting. This health record information may include internal and external sources of patient data.

| may include ii | noma an | | | | | |

| | 10. The system MAV century and maintain uper preferences for how the list of diagnoses are rendered | | | | 1634 | |
| more that | 11. The system SHOULD provide the ability to link statements regarding diagnoses with codes when more than one code is required for a condition (e.g., multiple codes for a single condition, late effects and cause, etiology and manifestation). | | | | | |
| AS.8.2 Function | | Support Rules-Driven Financial & Administrative Coding | S.3.2.2 | NC | 1636 | |

Statement: Provide financial and administrative coding assistance based on the structured data and unstructured text available in the encounter documentation.

Description: The user is assisted in coding information for billing or administrative reasons. For example, in the US Domain, the HIPAA 837 Professional claim requires the date of the last menstrual cycle for claims involving pregnancy. To support the generation of this transaction, the provider would need to be prompted to enter this date when the patient is first determined to be pregnant, then making this information available for the billing process.

| Section/Id#: Type: | Header/Function Name Conformance Criteria | Reference | Chg Ind | Row# |
|-----------------------|--|-----------|---------|------|
| AS.9 | Manage Administrative Transaction Processing | S.3.3 | NC | 1662 |
| Header | Wanage Auministrative Transaction Frocessing | 3.3.3 | INC | 1002 |

Statement: Support the creation (including using external data sources, if necessary), electronic interchange, and processing of transactions listed below that may be necessary foradministrative management during an episode of care.

Description: Support the creation (including using external data sources, if necessary), electronic interchange, and processing of transactions listed below that may be necessary for administrative management during an episode of care.

The EHR system collects patient health-related information needed for purpose of administrative and financial activities including reimbursement.

Captures the episode and encounter information to pass to administrative or financial processes (e.g., triggers transmissions of charge transactions as by-product of on-line interaction including order entry, order statusing, result entry, documentation entry, medication administration charting). Automatically retrieves information needed to verify coverage and medical necessity. As a byproduct of care delivery and documentation captures and presents all patient information needed to support coding. Ideally performs coding based on documentation.

Clinically automated revenue cycle - examples of reduced denials and error rates in claims.

Clinical information needed for billing is available on the date of service.

Physician and clinical teams do not perform additional data entry / tasks exclusively to support administrative or financial processes.

| AS.9.1 | Support Financial Plan Enrollment | C 2 2 1 | NC | 1663 |
|----------|-----------------------------------|---------|-----|------|
| Function | Support Financial Plan Enrollment | 3.3.3.1 | INC | 1003 |

Statement: Support interactions with other systems, applications, and modules to facilitate enrollment of uninsured patients into subsidized and unsubsidized health plans, and enrollment of patients who are eligible on the basis of health, and/or financial status in social service and other programs, including clinical trials.

Description: Expedites determination of health insurance coverage, thereby increasing patient access to care. The provider may be alerted that uninsured patients may be eligible for subsidized health insurance or other health programs because they meet eligibility criteria based on demographics, and/or health status. For example a provider is notified that the uninsured parents of a child enrolled in S-CHIP may now be eligible for a new subsidized health insurance program; a provider of a pregnant patient who has recently immigrated is presented with information about eligibility for subsidy. Links may be provided to online enrollment forms. When enrollment is determined, the health coverage information needed for processing administrative and financial documentation, reports or transactions is captured.

| 1. | . The system SHOULD provide the ability to capture subsidized and unsubsidized health plan options from internal or external sources to allow for presentation of alternatives for health care coverage to patients. | | | NC | 1664 |
|--------------------|---|--|-----------|----|------|
| 2. | The system SHOULD provide the ability to manage multiple status options for multiple registries and directories. (e.g., roster based, population based, research based funding; US initiatives of Accountable Care Organizations (ACO), Patient Center Medical Home (PCMH) and other managed care lists/memberships/directories). | | | NC | 1665 |
| 3. | 3. The system MAY provide the ability to capture government-sponsored health plan enrollment criteria. | | S.3.3.1#2 | NC | 1666 |
| 4. | The system MAY provide the ability to determine and render government sponsored plans that align with the patient's demographics (e.g., health and financial status). | | | NC | 1667 |
| AS.9.2 Function | | Support Financial Eligibility Verification | S.3.3.2 | NC | 1668 |

Statement: Support interactions with other systems, applications, and modules to enable eligibility verification for health insurance and special programs, including verification of benefits and pre-determination of coverage.

Description: Retrieves information needed to support verification of coverage at the appropriate juncture in the encounter workflow. Improves patient access to covered care and reduces claim denials. When eligibility is verified, the system could prompt a provider to capture eligibility information needed for processing administrative and financial documentation, reports or transactions; updating or flagging any inconsistent data. In addition to health insurance eligibility, this function would support verification of registration in programs and registries, such as chronic care case management and immunization registries. A system would likely verify health insurance eligibility prior to the encounter, but would verify registration in case management or immunization registries during the encounter.

5. Population Health Support Section

Section Overview

The Population Health Support Section focuses on those functions required of the EHR to support the prevention and control of disease among a group of people (as opposed to the direct care of a single patient), usually with something(s) in common, e.g., reside in the U.S., have diabetes, are under the age of 5, are treated by the same care provider, have pneumonia and are in a long-term care facility, etc. This section includes functions to support input to systems that perform medical research, promote public health, & improve the quality of care at a multi-patient level. Population health data must be managed carefully to avoid inadvertently breaching patient privacy and confidentiality. Individual patients may be identifiable within a population or aggregate based on information other than patient identifiers, e.g., age plus location, and/or based on a combination of public and population-based information. This section specifically addresses requirements related to patient privacy and consent for use of patient information for secondary uses, and/or reporting. All functions within the Population Health Support Section have an identifier starting with "POP".

| POP.1.2 | Present Notifications and Reminders | DC.2.5.2 | NC | 1270 |
| Function | for Preventative Services and Wellness | DC.2.5.2 | INC | 1270 |

Statement: Evaluate and notify patient, and/or provider of those preventative services, tests, or behavioral actions that are due or overdue

Description: The system generates notifications to patients regarding activities that are due or overdue. Examples include but are not limited to time sensitive patient and provider notification of follow-up appointments, laboratory tests, immunizations or examinations. The notifications can be customized in terms of timing, repetitions and administration reports. For example, a PAP test reminder might be sent to the patient two months prior to the test being due, repeated at three month intervals, and then reported to the administrator or clinician when nine months overdue.

| | 1. | • | LL capture, maintain, and render timely notifications to patients, and/or ers of preventative services, tests or behavioral actions that are due or overdue atient. | DC.2.5.2#1 | NC | 1271 |

| POP.2 Header | | | Support Population-Based Epidemiological Investigation | DC.2.6.1 | NC | 1279 |

Statement: Support for population-based internal and external epidemiological investigations of clinical health of aggregate patient data for use in identifying health risks from the environment, and/or population in accordance with jurisdictional law.

Description: A care provider, public health expert, or organization may wish to analyze data from cohorts, (i.e., subpopulations defined by certain characteristics or conditions). For example, cohorts can be described in terms of demographics; education and social status; health status, diseases, or outcomes; industry and occupation; or injuries. Population health analysts, such as experts in public health departments, may compile individual, and/or population information reported or otherwise gathered from multiple EHRs within the jurisdictional area for surveillance and research. Populations of one or none also can be informative. By analyzing specified data for a cohort, public health experts and care providers can monitor disease prevalence and health-related trends; evaluate behavioral, socioeconomical, occupational, and other impacts on health; and identify potential outbreaks and associated risk factors. Examples include:

- examining a cohort of patients with measles for a common (implied) exposure, such as attending the same school following a cohort of diabetics with out-of-range markers, or analyze them from various perspectives, such as by occupation, blood sugar range, drugs that are being used and not being used.
- examining a cohort of bakers for a higher-than-expected prevalence of asthma.
- Upon suspicion of a flu outbreak, reviewing a cohort of patients who have presented in the Emergency Department in the last three days complaining of breathing difficulty.
- Examining cohorts of smokers with lung disease, sand-blasters with breathing disorders, adults with asthma, etc. A broad range of information is used for population health surveillance and analyses, including (but not limited to) health status/disease/outcomes, completion/results of recommended health screens, current or previous medical treatment data, demographics, education, marital status, social factors, family history of diseases, personal history (e.g., alcohol and tobacco use, reading capability, hearing deficiency), and environmental factors (such as occupation and industry, shift-work, hobby). The information may or may not be coded; the text may be structured or unstructured. Person-level data is used to identify persons with specified characteristics such as exposures, symptoms, risk factors, injuries, genetic markers, diseases or health outcomes that may require further care. Person-level data also is required to evaluate groupings of injuries, diseases or adverse health outcomes. Issues of access to person-level data while securing patient privacy are relevant. Data also may be monitored and analyzed in "aggregate" (for example, by age range, geographic location, socio-economic level, or education level), depicting the quantity of records, and/or content within each aggregate. Aggregates may be used to report deidentified data to public health, for example, cases of influenza-like-illness by age range.

Case and population information are subject to public health reporting. Care organizations may require population health reports, for example, to measure quality of care based on health improvements for populations under the care of their providers. Statistical analyses are a key component to analyzing population health data, such as epidemiological investigations to identify relationships between risks (such as exposures or behaviors) and health conditions. Individual clinicians or healthcare organizations may employ limited capabilities in EHR systems to analyze population health data. The EHR system also should be capable of interacting with, and leveraging, the capabilities of specialized external analytical systems.

The investigator may hide or mask certain aspects of epidemiological investigation information, as necessary according to scope of practice, policy, and/or law. The investigator may desire to tag or remove patients from the cohort who have relocated or died.

| Section/Id#: Type: | Header/Function Name Conformance Criteria | Reference | Chg Ind | Row# |
|-----------------------|---|-----------|---------|------|
| POP.2.1 Function | Support for Epidemiological Investigation Data Collection | | NC | 1280 |

Statement: Support for Person-Level and Aggregate-Level Queries to Generate Population Cohorts, and/or Aggregates to be used in epidemiologic investigations and reports.

Description: Population health analysts (investigators) examine health data for trends and conditions through the use of well-defined queries to create their data sets. Preparing such well-defined queries, i.e., selection criteria and parameters, used to generate a cohort can be a complex and iterative process. The investigator may desire to use pre-defined or self-constructed queries (which may be saved for reuse). During the process of defining a query, the investigator may desire to accumulate statistics regarding the results of interim queries (e.g., number of patients in the query result) to determine the suitability of the queries, and subsequently modify the final query.

The investigator maintains sets of queries by constructing names that depict the cohorts, the fields comprising the queries and, perhaps, values for those fields. The resultant data set generated should be validated against the intended purpose of the query. Queries may need to be saved to support future analysis of the same (or a similar) cohort. For example, the investigator may construct an "Insulin study for males age 65 and older" query that is used to review patients of a specific age, gender and drug usage, then also construct an "Insulin study for females age 65 and older" query by modifying a copy of the first one. Queries may identify "static" or "dynamic" cohorts. A "static cohort" query identifies and monitors certain patients within a given cohort over time (e.g., pregnant patients who arrived in the Emergency Department in January, 2012 and followed throughout their pregnancies).

A "dynamic cohort" query may identify new patients to be added periodically to a cohort (e.g., the number of pregnant patients who arrived in the Emergency Department during each month). Information compiled by using a query may need to be governed by applicable policies and regulations. For example, psychiatric data may need to be excluded from a given epidemiological investigation. The query may need to specify that subjects are de-identified or aggregates are created according to the requirements of the analysis or privacy restrictions. For example, queries may be made of de-identified aggregate subjects to evaluate possible medical products safety issues quickly and securely. Data aggregation may be used to de-identify subjects, to condense the cohort, or to sub-divide a given cohort into various "aggregates" (for example, by age range, geographic location, socio-economic level, or education level), depicting the quantity of records, and/or content within each aggregate. Aggregate data may need to be integrated or linked d within or across cohorts. The criteria for data aggregation also may be applied to different cohorts.

| 1. | The system SHALL provide the ability to manage queries (e.g., criteria and parameters based on surveillance parameters, demographic, and/or clinical information) for use in extracting one or more cohorts, and/or aggregates according to scope of practice, organizational policy, and/or jurisdictional law. | | NC | 1281 |
|-----|---|------------|----|------|
| 2. | The system SHALL provide the ability to capture and maintain pre-defined criteria and parameters (e.g., based on demographic, and/or clinical information) for use in extracting one or more cohorts, and/or aggregates. | | NC | 1282 |
| 3. | The system SHALL provide the ability to capture and maintain ad hoc criteria and parameters specified by the user (e.g., based on demographic, and/or clinical information) for use in extracting one or more cohorts, and/or aggregates | | NC | 1283 |
| 4. | The system SHALL provide the ability to capture and render the attributes (namely, the metadata) of a query (for example, query name, description, fields, values, and/or assumptions). | | NC | 1284 |
| 5. | The system SHALL provide the ability to maintain new cohort or cohorts. | | NC | 1285 |
| 6. | The system SHOULD provide the ability to integrate previously-defined cohorts. | | NC | 1286 |
| 7. | The system SHOULD provide the ability to integrate previously-defined aggregates within a cohort, and/or across cohorts and maintain the new aggregate or aggregates. | | NC | 1287 |
| 8. | The system SHALL provide the ability to manage data-visibility as a query component according to scope of practice, organizational policy, and/or jurisdictional law | | NC | 1288 |
| 9. | The system SHOULD provide the ability to render indicators (e.g., to investigators, caregivers or patients) regarding the queries in which a certain patient was included according to scope of practice, organizational policy, and/or jurisdictional law. | | NC | 1289 |
| 10. | The system SHOULD conform to function TI.5.3 (Standards-Based Application Integration) to support the creation of a query. | | NC | 1290 |
| 11. | The system SHALL provide the ability to manage ad hoc inquiries from public health organizations (e.g., requests for information related to demographic or clinical information) according to scope of practice, organizational policy, and/or jurisdictional law. | | NC | 1291 |
| 12. | The system SHALL provide the ability to manage case-reporting requirements defined by public health organizations as queries according to scope of practice, organizational policy, and/or jurisdictional law. | | NC | 1292 |
| 13. | The system MAY provide the ability to capture, maintain, and render sets of questions that support disease outbreak investigations (e.g., disease-exposure questionnaires, disease-tranmission contact tracing). The sets of questions are authored by public health authorities and facilitate patient-information gathering by the care provider. | DC.2.6.2#9 | NC | 1318 |

| POP.2.2 | Support for Epidemiologic Data-Analysis | | NC | 1293 |
| Function | | | INC | 1293 |

Statement: Support for Cohort Person-Level and Aggregate-Level Data Content and Analysis

Description: The EHR system assists care providers, public health experts and others in assessing patient and population health conditions. Healthcare can be improved if analyses are performed on a population basis to evaluate care delivery, health status and disease trends, and identify potential modifiable risk factors. The various ways of analyzing a population (cohort) can be complex. Some population-based research examines relationships between events or exposures and their corresponding outcomes. Other populationbased research may focus on healthcare utilization, service availability and quality of care. Population-level surveillance, monitoring of disease, and epidemiologic research involves analysis of data based on existing relationships between pre-defined and well-known data elements. These analyses utilize various data elements including demographics, education, marital status, social factors, family history of diseases, personal history (e.g., alcohol and tobacco use, reading capability, hearing impairment), environmental factors (such as proximity to toxic exposures), occupational factors (such as type of occupation and industry, shift-work, training, hobby), genomic and proteomic data elements, resource utilization, problem lists, and other clinical information. The identification of new and previously unrecognized patterns of disease may require sophisticated pattern recognition analysis. Early recognition of new patterns may require data available early in the disease presentation. For example, an investigation of pneumococcal disease may involve a trend analysis of the causative serotype (laboratory data) over time, evaluated per age group of patients diagnosed with pneumonia (aggregates). Several aggregates may be identified (e.g., multiple age groups). Each aggregate then is analyzed as a group for selected data pattern(s) using data elements that include, but are not limited to, patient demographics, presenting symptoms, acute treatment regimens, occupational information, and laboratory and imaging study orders and results.

| 1 | The system SHALL provide the ability to manage query results (i.e., cohorts, and/or aggregates) according to scope of practice, organizational policy, and/or jurisdictional law. | | NC | 1294 |
|---------------------|--|--|----|------|
| 2 | The system SHOULD provide the ability to analyze various combinations of aggregates within a cohort (e.g., to determine the adequacy of patient confidentiality in the result). | | NC | 1295 |
| 3 | The system SHALL provide the ability to manage person-level information in a cohort or aggregate using user-identified, and/or pre-defined criteria (e.g., demographic or clinical information) according to scope of practice, organizational policy, and/or jurisdictional law | | | 1296 |
| 4 | 4. The system SHOULD provide the ability to determine, tag and render changes in dynamic cohorts. | | | 1297 |
| 5 | The system SHOULD conform to function T1.5.3 (Standards-Based Application Integration) to manage query results. | | NC | 1298 |
| 6 | The system SHOULD provide the ability to analyze and render statistical information that has been derived from query results, including, but not limited to, person-level data and aggregates. | | NC | 1299 |
| POP.2.3 Function | Support for Cohort and Aggregate Data Sharing | | NC | 1300 |

Statement: Support cohort and aggregate-level population data sharing within an organization, and/or with other organizations.

Description: Population health data needs to be shared in a number of formats. The cohort and aggregate data (query results) may need to be shared within a facility or transmitted to other organizations on an ad hoc or periodic (namely, regularly scheduled) basis. For example, public health surveillance, monitoring and research often rely on analysis of data from multiple sources, including EHR systems. The data may need to be prepared in user-defined formats or formats defined by external parties. The care provider, public health expert, or organization may need to transmit individual or aggregate data in multiple formats (e.g., to an external statistical analytic application or to public health agencies to meet reporting requirements). Query results may need to be viewed, saved, and/or printed in pre-defined or ad hoc report formats, (e.g., for quality reporting within the care organization). Some or all members of a cohort or population may need to be anonymized, depending on the rules governing the data sharing.

| The system SHALL provide the ability to capture, maintain, and render a request for a population- based query result according to scope of practice, organizational policy, and/or jurisdictional law. | NC | 1301 |
|---|----|------|
| 2. The system SHALL provide the ability to capture, maintain, and render pre-defined report criteria (e.g, fields to be included in the resulting report or dataset), parameters, formats, and metadata that specify use, and/or reuse of the reported data according to scope of practice, organizational policy, and/or jurisdictional law (e.g., the metadata may indicate that the report is intended for initial, confirmatory or other analyses). | NC | 1302 |
| 3. The system SHOULD provide the ability to enter, maintain, and render ad hoc (user-specified) report criteria (e.g., the fields to be included in the resulting report or dataset), parameters, formats, and metadata that specify use, and/or reuse of the reported data according to scope of practice, organizational policy, and/or jurisdictional law (e.g., the metadata may indicate that the report is intended for initial, confirmatory or other analyses). | NC | 1303 |
| 4. The system SHALL provide the ability to maintain and render the results of a query (e.g., person-level lists, case reports, or aggregates) as specified by the requestors' report criteria using a recognized or a locally-defined standard (e.g., via reporting formats that are specified by public health guidelines). | NC | 1304 |
| 5. The system SHALL provide the ability to capture, maintain, and render with reports the metadata that specify use, and/or reuse of the reported data according to scope of practice, organizational policy, and/or jurisdictional law (e.g., the metadata may indicate that the report is intended for preliminary, confirmatory or other analyses; or the metadata may also indicate that the data may only be used for surveillance purposes). | NC | 1305 |
| 6. IF standardized transmission of the results of a query are required to/from a registry or directory, THEN the system SHALL conform to function TI.3 (Registry and Directory Services). | NC | 1306 |

| pr | rivacy and confide | L provide the ability to render the results of a query according to applicable entially rules (to prevent identification of individuals by unauthorized parties) of practice, organizational policy, and/or jurisdictional law. | | NC | 1308 |
| in (e or au | ncluding clinical inf e.g., public health i rganizational polic | provide the ability to transmit information related to individual case reports, formation (e.g., test results) from a care provider to public health organizations notifiable, and/or reportable condition programs) according to scope of practice, by, and/or jurisdictional law (e.g., a care provider notifies the local public health ividual case of a sexually-transmitted disease that was identified during the diguery). | | NC | 1309 |
| po | opulation-based o | JLD provide the ability to capture, maintain, and render the request for a juery result using a recognized-standard, and/or locally-defined report format ling to jurisdictional law. | | NC | 0 |
| POP.3 Function | | Support for Notification and Response | DC.2.6.2 | NC | 1310 |

Statement: Upon notification by an external, authoritative source of a health risk within the cared-for population, alert relevant providers regarding specific potentially at-risk patients with the appropriate level of notification.

Description: After receiving a notice of a health risk within a cared-for population from public health authorities or other external authoritative sources:*Identify and notify individual care providers or care managers that a risk has been identified and requires attention; and *Provide suggestions on the appropriate course of action.

A care provider now has the ability to decide how patients are notified, if necessary. For example, this function may be used after detection of a local outbreak of hepatitis A, advising providers of the at-risk population and potential prophylactic treatment. A second example might be the dissemination of new care guidelines for elderly patients with a specific chronic disease.

Notifications to clinicians or patients may occur by telephone, email, FAX or other methods.

| 1 | care providers or | L provide the ability to capture, maintain and render the identity of individual care managers within a cared-for population according to scope of practice, cy, and/or jurisdictional law. | DC.2.6.2#1 | NC | 1311 |
|-------------------|---|---|------------|----|------|
| 2 | | L provide the ability to render a response notification to the care providers or hin a cared-for population that a health risk notification was received. | DC.2.6.2#3 | NC | 1312 |
| 3 | The system SHALL provide the ability to capture, maintain and render notification of a health risk within a cared-for population from public health authorities or other external authoritative sources. | | | NC | 1313 |
| 4 | • | The system SHOULD provide the ability to manage, in coordination with local, regional, state and national programs, dissemination of notifications of health risk to individual care providers or caremanagers. | | | 1314 |
| Į. | | The system SHOULD provide the ability to transmit notifications to patients, directly or indirectly, who are described by the health risk alert. | | NC | 1315 |
| (| 6. The system SHOULD determine and present suggestions to the care provider indicating an appropriate course of action regarding a population health risk notification. | | DC.2.6.2#6 | NC | 1316 |
| 7 | 7. The system SHALL provide the ability to render notifications/reports to public health authorities or other external authorities regarding health risks within a cared-for population according to scope of practice, organizational policy, and/or jurisdictional law. | | | NC | 1317 |
| POP.4 Function | | Support for Monitoring Response Notifications Regarding a Specific Patient's Health | DC.2.6.3 | NC | 1319 |

Statement: In the event of a health risk alert, evaluate whether expected actions have been taken, and execute follow-up notification otherwise.

Description: The system assists in follow-up for a specific patient event that has failed to occur (e.g., follow up to a health alert or absence of an expected laboratory result) and communicate the omission to the appropriate care provider(s).

| 1. | The system SHALL determine and render to the provider specific recommended actions that may be taken at the patient level regarding a health risk alert. | DC.2.6.3#1 | NC | 1320 |
|----|---|------------|----|------|
| 2. | The system SHALL determine and render a notification to appropriate care providers of specific actions to be taken regarding the set of patients who are the target of a health risk alert. | DC.2.6.3#2 | NC | 1321 |
| 3. | The system SHALL determine and render a list of those patients who have not received appropriate action in response to a health risk alert. | DC.2.6.3#3 | NC | 1322 |
| 4. | The system SHALL provide the ability to determine and render a status report regarding the compliance of the set of all patients who are the target of a health risk alert. | DC.2.6.3#4 | NC | 1323 |

| Function | Donor Management Support | 3.1.2 | INC | 1324 |

Statement: Manage population-based information regarding potential human-product donors, and/or recipients.

Description: Population-based health risks often require the identification of potential donors and recipients (e.g., during a disaster, blood is often needed). Other population-based donors and recipients may need to be identified for items such as organs, eggs, sperm, or stem cells. The user can make this information available to internal and external donor matching agencies. A consent or authorization includes patient authorization for redisclosure of sensitive information to third parties (such as donor management).

Statement: Support the capture and subsequent export or retrieval of data necessary for the measurement, analysis, research and reporting.

Description: Information from the EHR-S may be used to support measurement, analysis, research and reporting to improve the provision of care. Reporting may include:

- reporting on patient outcome of care by population, facility, provider or community;
- providing quality, performance, and accountability measurements for which providers, facilities, delivery systems, and communities are held accountable;
- support process improvement measures and related initiatives; and- support health care organizational performance monitoring and improvement.

| POP.6.1 | Outcome Measures and Analysis | S 2 1 1 | NC | 1331 |
|----------|---------------------------------|---------|-----|------|
| Function | Outcome inteasures and Analysis | 0.2.1.1 | INC | 1331 |

Statement: Support the capture and subsequent export or retrieval of data necessary for the reporting on patient outcome of care by population, facility, provider or community.

Description: Many regions require regular reporting on the healthcare provided to individuals and populations. The system needs to provide the report-generating capability to easily create these reports or provide for the export of data to external report-generating software. The system may also provide the functionality to prompt for the collection of necessary information at the appropriate time in a patient encounter if such collection need can be properly defined in a workflow (e.g., requesting specific information for reporting of emergency services such as drug overdose, suspected abuse, communicable diseases, or for the collection of additional research data for a specific diagnosis).

| 1. The system | SHOULD provide the ability to render data required to evaluate patient outcomes. | S.2.1.1#1 | NC | 1332 |

| POP.6.2 Function | Quality, Performance and Accountability Measures | S.2.1.2 | NC | 1342 |

Statement: Support the capture and subsequent export or retrieval of patient, and/or population data necessary to provide quality, performance, and accountability measurements for which providers, facilities, delivery systems, and communities are held accountable.

Description: Many regions require regular reporting on the healthcare provided to individuals and populations. This reporting may include measures related to or addressing processes, outcomes, costs of care, quality of care, adherence to best practice guidelines, and credentialing and privileging monitoring. The system needs to provide the report-generating capability to easily create these reports or provide for the export of data to external report-generating software.

| 1. | | ULD provide the ability to render patient, and/or population data required to lity, performance and accountability measures to appropriate organizations. | S.2.1.2#1 | NC | 1343 |
|---------------------|---------------------|---|-----------|----|------|
| 2. | health care quality | JLD provide the ability to capture and maintain multiple data sets required for performance and accountability measurements (e.g., the number of flu shots per of pregnant women counseled to take folic acid). | S.2.1.2#2 | NC | 1344 |
| 3. | | ULD render patient, and/or population health care quality, performance and asures data in a report format that can be displayed, transmitted electronically, | S.2.1.2#3 | NC | 1345 |
| 4. | | ULD render patient, and/or population health care quality, performance and asures data or query results through a secure data service. | S.2.1.2#4 | NC | 1346 |
| 5. | performance and a | OULD determine and render patient, and/or population health care quality, accountability measures in real-time, near real-time or just-in-time according to organizational policy, and/or jurisdictional law. | | NC | 1347 |
| 6. | used for measuring | determine and render to administrative and financial systems the formula g patient, and/or population health care quality, performance and accountability ing to scope of practice, organizational policy, and/or jurisdictional law. | | NC | 1348 |
| POP.6.3 Function | | Support for Process Improvement | | NC | 1351 |
| | | | | | |

Statement: Support the capture and subsequent export or retrieval of data necessary to support process improvement measures and related initiatives.

Description: Many organizations and institutions may require regular reporting of data necessary to support improvement in the effectiveness and efficiency of care. These reports may include, but is not limited to, specific data such as patient outcomes, patient safety, processes of care, workflow and costs of care. The system needs to provide the report generating capability to easily create these reports or provide for the export of data to external report generating software.

| 1. | | JLD provide the ability to capture necessary data (e.g., clinical user feedback) ational efforts to optimize the EHR System (EHR-S). | | NC | 1352 |
|---------------------|---|--|--|----|------|
| 2. | The system SHOULD provide the ability to capture necessary data (e.g., patient satisfaction feedback) supporting organizational efforts to improve the quality of healthcare and patient satisfaction. | | | | 1353 |
| 3. | The system SHOULD provide the ability to analyze returned patient survey data and render the results to facilitate improvements in provider-patient interactions, healthcare delivery, etc. | | | NC | 1354 |
| 4. | 4. The system SHOULD provide the ability to manage realm or organizational relevant health care delivery performance measurements (e.g., Healthcare Effectiveness Data and Information Set (HEDIS), time to aspirin from arrival, or time to antibiotics in pneumonia). | | | NC | 1355 |
| 5. | 5. The system SHOULD provide the ability to manage ad hoc health care delivery performance measurements (e.g., Healthcare Effectiveness Data and Information Set (HEDIS), time to aspirin from arrival, or time to antibiotics in pneumonia). | | | NC | 1356 |
| POP.6.4 Function | | Support for Care System Performance Indicators (Dashboards) | | NC | 1357 |

Statement: Capture, determine and render data necessary to support health care organizational performance monitoring and improvement.

Description: Health care organizations and institutions may seek to display summary information to assist in care system performance, in the form of dashboards and graphic displays, to support delivery of care and improvement of processes. These dashboards should utilize all appropriate data available in the system to address the healthcare system's process improvement and care delivery issues and then display the results in appropriate role-based formats. These displays may be in the form of routine daily, weekly or monthly graphics or real-time displays of selected metrics to improve care delivery, and/or performance. Note: Even though the system may be capable of automatically managing certain data-driven feedback mechanisms, it is also necessary for the provider to have the ability of manually managing certain feedback mechanisms (e.g., by overriding the system's choices).

| The system SHALL provide the ability to manage data-driven feedback mechanisms that assist in patient management and healthcare delivery. | NC | 1358 |
|--|----|------|
| 2. The system SHOULD provide the ability to manage data-driven feedback mechanisms, (e.g., reports, dashboards, watchboards), that assist in patient management and healthcare delivery. | NC | 1359 |

| Section/Id#: Type: | Header/Function Name Conformance Criteria | Reference | Chg Ind | Row# |
|--|---|-----------|---------|------|
| 3. The system SHOULD render real-time departmental load metrics (e.g., nurse-to-patient ratios, Emergency department capacity limits), automatically (i.e., without further human intervention). | | | NC | 1360 |
| POP.7 Function | Public Health Related Updates | S.3.7.4 | NC | 1361 |

Statement: Receive and validate formatted inbound communications to facilitate updates to the system's public health reporting guidelines.

Description: Information and reporting requirements from outside groups, such as public health organizations, may be made available to care providers. Examples may include requirements to report on new disease types, or changes to reporting guidelines. The information in these public health updates may be applied to the system so that appropriate data can be collected and reported to comply with requirements.

| 1. The system SHOU | LD provide the ability to capture and update public health reporting guidelines. | S.3.7.4#1 | NC | 1362 |
|---|--|-----------|----|------|
| 2. The system MAY provide the ability to render information that will promote the validation of the public health education material prior to update. | | S.3.7.4#2 | NC | 1363 |
| POP.8 Function | De-Identified Data Request Management | S.1.5 | NC | 1364 |

Statement: Provide patient data in a manner that meets applicable requirements for de-identification.

Description: When an internal or external party requests patient data and that party requests de-identified data (or is not entitled to identified patient information, either by law or custom), the user can export the data in a fashion that meets the requirements for de-identification in that locale or realm.

An auditable record of these requests and associated exports may be maintained by the system. This record could be implemented in any way that would allow the who, what, why and when of a request and export to be recoverable for review.

A random re-identification key may be added to the data, to support re-identification for the purpose of alerting providers of potential patient safety issues. For example, if it is discovered that a patient is at risk for a major cardiac event, the provider could be notified of this risk, allowing the provider to identify the patient from the random key.

| 1. | | LL conform to function TI.1.8 (Patient Privacy and Confidentiality) when tified views of data according to scope of practice, organizational policy, and/v. | S.1.5#1 | NC | 1365 |
|-------------------|--|--|----------|----|------|
| 2. | The system SHOL | JLD provide the ability to de-identify extracted information. | S.1.5#2 | NC | 1366 |
| 3. | , | LD provide authorized users the ability to tag data for de-identification according e, organizational policy, and/or jurisdictional law. | S.1.5#3 | NC | 1367 |
| 4. | • | ULD provide authorized users the ability to transmit de-identified data to according to scope of practice, organizational policy, and/or jurisdictional law. | | NC | 1368 |
| 5. | 5. The system SHOULD provide the ability to transmit a re-identification key to recipients of de- identified data according to scope of practice, organizational policy, and/or jurisdictional law. | | | NC | 1369 |
| 6. | 6. The system SHOULD provide the ability to edit discrete patient identifiers from all reports containing data on multiple patients according to scope of practice, organizational policy, and/or jurisdictional law (e.g., replace "John Smith" with "***"). | | | NC | 1370 |
| POP.9 Function | | Support Consistent Healthcare Management of Patient Groups or Populations | DC.2.2.2 | NC | 1371 |

Statement: Provide the ability to identify and consistently manage healthcare over time and across populations or groups of patients that share diagnoses, problems, functional limitations, treatment, medications, and demographic characteristics that may impact care (e.g., population management, disease management, wellness management or care management).

Description: Populations or groups of patients that share diagnoses (such as diabetes or hypertension), problems, functional limitations, treatment, medication, and demographic characteristics such as race, ethnicity, religion, socio-economic status that may impact care are identified for the clinician. The clinician is advised and assisted with management of these patients to optimize the clinician's ability to provide appropriate care. For example, a clinician is alerted to information regarding racial, cultural, religious, socio-economic, living situation and functional limitations of the patient that are required to provide appropriate care. among other examples are notification of the patients' eligibility for a particular test, therapy, or follow-up; availability of supportive resources in the community; or results from audits of compliance of these populations with disease management protocols. The system may also Include the ability to identify groups of patients based on clinical observations or laboratory test results and assist in initiating a follow-up or recall for selected patients.

The system may also provide the ability to create and render configurable reports for specific populations/or topics of interest, (e.g., chronic conditions, suicidal risk, or post traumatic stress syndrome, traumatic brain injury, etc.)

| 1. | The system SHALL conform to function CPS.3.4 (Support for Context-Sensitive Care Plans, Guidelines, Protocols). | DC.2.2.2#1 | NC | 1372 |
|----|--|------------|----|------|
| 2. | The system SHALL provide the ability to identify patients eligible for healthcare management protocols based on criteria identified within the protocol. | DC.2.2.2#2 | NC | 1373 |
| 3. | The system SHOULD provide the ability to include or exclude a patient from an existing healthcare management protocol group. | DC.2.2.2#3 | NC | 1374 |
| 4. | The system SHOULD provide the ability to capture, maintain and render the reason for inclusion or exclusion from a protocol or protocol group. | | NC | 1375 |
| 5. | The system SHOULD provide the ability to audit compliance of selected populations and groups that are the subjects of healthcare management protocols. | DC.2.2.2#4 | NC | 1376 |

| Section/Id#: Type: | Header/Function Name Conformance Criteria | Reference | Chg Ind | Row# |

| 6. The | e system SHALL conform to function CPS.9.4 (Standard Report Generation). | DC.2.2.2#5 | NC | 1377 |
| | e system SHOULD provide the ability to determine and present groups of patients based on illar attributes, as can be found in clinical observations or laboratory test results. | DC.2.2.2#7 | NC | 1378 |
| | e system SHALL capture, maintain, and render the information necessary for patient follows or recalls. | DC.2.2.2#8 | NC | 1379 |
| 9. The | e system SHALL capture, maintain, and render protocols and guidelines for follow-ups or recalls. | | NC | 1380 |
| | e system SHOULD determine and present notifications to initiate follow-ups or recalls based protocols and guidelines. | | NC | 1381 |
| | e system SHOULD capture research protocol deviation information, including any verbatim text protocol deviation. | | NC | 1382 |
| POP.10 Function | Manage Population Health Study-Related Identifiers | | NC | 1383 |
| Descrip Study ke | ent: Manage information that identifies key elements of a research or population study. tion: Research or population studies can be distinguished from each other through the proper usey elements may include identifying the study, location where the study is being performe ator. Identifiers are managed through their lifecycle including capture, maintenance and render | d, patient sub | | |
| | e system SHOULD provide the ability to manage unique research identifiers (i.e. sponsor-vided Protocol mnemonic) such that the research study can be identified. | | NC | 1384 |
| | e system SHALL provide the ability to manage the site identification number(s) as assigned by Sponsor. | | NC | 1385 |
| ide No | e system SHALL provide the ability to manage unique research subject identifiers (e.g., these ntifiers could be used as a screening number prior to the subject qualifying for the clinical trial). te: A given patient may have multiple research subject identifiers if the patient has been on ltiple research studies. | | NC | 1386 |
| | e system SHOULD provide the ability to manage clinical research identifiers (e.g., investigator ntifier or visit name) as discrete data elements. | | NC | 1387 |

6. Record Infrastructure Section

Section Overview

The Record Infrastructure Section consists of functions common to EHR System record management, particularly those functions foundational to managing record lifecycle (origination, attestation, amendment, access/use, translation, transmittal/disclosure, receipt, de-identification, archive...) and record lifespan (persistence, indelibility, continuity, audit, encryption). RI functions are core and foundational to all other functions of the Model (CP, CPS, POP, AS). Note extensive reference to RI functions in Overarching Criteria. RI functions may be implemented within the architecture of a single system or across a tightly coupled suite of systems (applications). All functions within the Record Infrastructure Section have an identifier starting with "RI".

| Section/Id#: Type: | Header/Function Name Conformance Criteria | Reference | Chg Ind | Row# |
|-----------------------|---|-----------|---------|------|
| RI.1 Header | Record Lifecycle and Lifespan | 14.1 | NC | 1695 |

Statement: Manage Record Lifecycle and Lifespan

Description: Actions are taken to support patient health. Actions are taken in provision of healthcare to individuals. Actions are taken as the result of rules-based EHR System algorithms. Actors (i.e., patients, providers, users, systems) take Actions. (Actions broadly encompass tasks, acts, procedures or services performed or provided.) The EHR System captures Actions taken and creates corresponding Record Entries. Record Entries provide persistent evidence of Action occurrence, context, disposition, facts, findings and observations. From the point of Record Entry origination to the end of its lifespan, the EHR System manages each Entry consistent with and according to scope of practice, organizational policy, and jurisdictional law. In support of individual health and in provision of healthcare to individuals, Actors perform Actions and Actions have corresponding Entries in the EHR Record, (i.e., Action instances are documented by Record Entry instances). Record Entries may be captured during the course of the Action or sometime thereafter. The Actor (author/source) of the Record Entry may be the same as an Actor performing the Action or not. The EHRS Functional Model does not specify a particular relationship of Actions and corresponding Record Entries. It may be one to one, many to one or even one to many. Actions have associated metadata (e.g., who, what, when, where, why, how, under what conditions, in what context). The corresponding Record Entry related information.

Each Record Entry also includes its own provenance metadata such as who (authoring Actor) and when (documented). Record Entries may be encapsulated to bind Actor (individual, organization, and/or system) signatures to data and metadata content and data/time of occurrence. Actions and related Record Entries capture a chronology of patient health and healthcare and also a chronology of operations and services provided in/by a healthcare enterprise. Record Entries reflect changes in health information from the time it was created, to the time it was amended, sent, received, etc. In this manner, each Record Entry serves as persistent evidence of an Action taken, enabling providers to maintain comprehensive information that may be needed for legal, business, and disclosure purposes. To satisfy these purposes, Record Entries must also be retained and persisted without alteration. Record Entries have both a lifecycle and a lifespan. Lifecycle Events include originate, retain, amend, verify, attest, access/view, de-identify, transmit/receive, and more. Lifecycle Events occur at various points in a Record Entry lifespan, always starting with a point of origination and retention (i.e., when the Entry is first created and stored). A Record Entry may have a pre and post Event state if content is modified. In this case, the original Record Entry is preserved (with signature binding) and a new Entry is created (with new signature binding). A Record Entry contains data and metadata, in multiple formats, following various conventions and standards. Included data may be tagged, and/or delimited, structured (concise, encoded, computable), or unstructured (free form, non-computable). Data may be encoded as text, document, images, audio, waveforms, in ASCII, binary or other encoding. Structured data may be characterized as being concise, encoded, computable, and may be divided into discrete fields.

Examples of structured health information include:

- patient residence (non-codified, but discrete field)
- diastolic blood pressure (numeric)
- coded laboratory result or observation
- coded diagnosis
- patient risk assessment questionnaire with multiple-choice answers.

Unstructured data may be characterized as being free form, and/or non-computable. Unstructured health record information is information that is not divided into discrete fields AND not represented as numeric, enumerated or codified data.

Examples of unstructured health record information include:

- text (text message to physician) - word processing document (a letter from a family member) - image (photograph of a patient or a scanned image of insurance card) - multimedia (dictated report or a voice recording).

Context may determine whether data are structured or unstructured. For example, a progress note might be standardized and structured in some systems (e.g., Subjective/Objective/Assessment/Plan) but unstructured in other systems. The EHR System manages Record Lifecycle Events for each Record Entry, including pre and post Event record states, continuity, persistence and related Record Audit Logs.

| RI.1.1.2 Function | Amend Record Entry Content | 14.2.1 | NC | 1728 |

Statement: Amend content of a Record Entry (1 instance)

Description: Occurs when Record Entry content is modified (from its original or previously retained state) – typically upon conclusion of an Action, to correct, update or complete content.

- Amended Record Entry content is the responsibility of authorized amendment Author(s).
- The amendment becomes part of the Act Record revision history, where the original content and any previous amendments are retained without alteration.
- After amendment, the System is responsible for retention of the Record Entry and its revision history.
- An Audit Trigger is initiated to track Record Entry amendment.

Reference: ISO 21089, Section 12.3.2

NC The system SHOULD capture a reference (e.g., link, pointer) to pre-amendment data for each amended Record Entry. |

Statement: Translate content of Record Entries (1 or more instances)

Description: Occurs when Record Entries are amended to include translation of content – typically to transform coded data from one coding/classification scheme to another, also from one human language to another.

- Translated (amended) Record Entry content is the responsibility of translating System which invokesmapping/translation rules for each relevant record attribute.
- The translation amendment becomes part of the Record Entry revision history, where original content andany previous amendments are retained without alteration.
- After translation amendment, the System is responsible for retention of the Record Entry and its revisionhistory (including the translation event).
- An Audit Trigger is initiated to track Record Entry translation.

Reference: ISO 21089, Sections 12.3.2 and 12.4.

1. The system SHALL provide the ability to render coded Record Entry content translated from one coding/classification system to another.

Statement: Attest to content of Record Entry (1 instance)

Description: Occurs when Record Entry content is attested for accuracy and completeness – typically during/after conclusion of an Action.

- Attested Record Entry content is the responsibility of Attesting Author. The Attesting Author may be someone other than the originating Author, i.e., a supervisor, proctor, preceptor or other designated individual.
- An Audit Trigger is initiated to track Record Entry attestation.

The purpose of attestation is to show authorship and assign responsibility for an act, event, condition, opinion, or diagnosis. Every Record Entry must be identified with the author and should not be made or signed by someone other than the author unless they have authority to do so. For example, a resident may author Record Entry content but the person taking legal authority for the content is the "attester" – both individuals should be identified. (Note: A transcriptionist may transcribe an author's notes and a senior

clinician may attest to the accuracy of another's statement of events.)- Author: All users who create or contribute content and have a role in the development of a Record Entry. Some entries may be created by an author whose role is a student, transcriber or scribe.

- Attester: A user who takes legal authority for Record Entry content. The attester is often the same as the author, but they may also be an individual with authority to take responsibility for Record Entry content created in whole or in part by another author(s) (e.g., student, scribe, transcriptionist). | 8. | 8. The system SHOULD capture identity of the location (i.e., network address) where Record Entry content is re-identified. | | NC | 1934 |
| 9. | The system MAY capture the rationale for re-identifying Record Entry content. | | NC | 1935 |
| RI.1.1.13 Function | Extract Record Entry Content | | NC | 1936 |

Statement: Extract Record Entry content to produce subsets, derivations, summaries or aggregations (Multiple instances)

Description: Occurs when Record Entry content is extracted to render subsets, derivations, summaries or aggregations.

- Extraction of Record Entry content may be initiated by User command, and/or rules-based algorithm.
- Extraction of Record Entry content is the responsibility of the System which invokes relevant rules.
- An Audit Trigger is initiated to track Record Entry content extraction. Reference: ISO 21089, Section 12.7. An EHR-S enables an authorized user, such as a clinician, to access and aggregate the distributed information, which corresponds to the health record or records that are needed for viewing, reporting, disclosure, etc. An EHR-S must support data extraction operations across the complete data set that constitutes the health record of an individual and provide an output that fully chronicles the healthcare process. Data extractions are used as input

to patient care coordination between facilities, organizations and settings. In addition, data extractions can be used for administrative, financial, research, quality analysis, public health purposes, and to enable re-creation of copies for importing into different EHR applications and enable the archiving of patients' data. Data may be extracted in order to meet analysis and reporting requirements. The extracted data may require use of more than one application and it may be pre-processed (for example, by being de-identified) before transmission. Data extractions may be used to exchange data and provide reports for primary and ancillary purposes.

| Function | | Evidence of Record Entry Extraction Event | | NC | 1948 |

Statement: Manage Record States

Description: Record Entries may reside in various states that must be managed. An important underlying principle for managing record states is the need to retain Record Entries that have been viewed for patient care purposes even if the Entry has not been completed or attested. This principle has important legal impact because it provides an account of what the provider viewed and relied on for clinical decision-making. For example, if Record Entry content was available in pending state and a clinician used the information to make decisions, it is important to retain the pending version even after the final version was available. Determining if Record Entry content was used for patient care may be challenging. Access logs could provide a mechanism to determine if the information was used.

| RI.1.3.1 | Manage Record Pending State | NC | 21/11 |
|----------|-----------------------------|-----|-------|
| Function | Manage Necold Fending State | INC | 2141 |

Statement: Manage Record Entries during the various states of completion.

Description: Record Entries may reside in various states that must be managed. An important underlying principle for managing record states is the need to retain Record Entries that have been viewed for patient care purposes even if it has not been completed or attested. This principle has important legal impact because it provides a record of what the provider relied on for clinical decision-making. For example, if a Record Entry was available in pending state and a clinician accessed the information to make decisions, it is important to retain the pending version even after the final version was available. Determining if the Record Entry was accessed for patient care may be challenging. Access logs should show if the information was accessed/viewed.

| The system SHOULD provide the ability to manage the length of time a Record Entry can be in a pending or inactive state before being administratively closed. | NC | 21 | 142 |
|--|----|----|-----|
| 2. The system MAY present a notification to the author or designate that a Record Entry will be administratively closed after a designated period of time. | NC | 21 | 143 |
| 3. The system MAY present pending Record Entries in accordance with the organization's business rules. | NC | 21 | 144 |
| IF the system displays pending Record Entries, THEN the system SHALL tag and present that a Record Entry is pending or incomplete. | NC | 21 | 145 |
| 5. The system SHOULD provide the ability to update a Record Entry status to one of: - complete, - complete while retaining incomplete version of the Entry if viewed for patient care or used by the system, - mark as erroneous and retain if Entry used for patient care or by the system, or - discard if Entry never viewed for patient care purposes. | NC | 21 | 146 |
| 6. The system SHOULD provide the ability to manage administrative closure of a Record Entry after a period of inactivity according to scope of practice, organizational policy, and/or jurisdictional law. | NC | 21 | 147 |
| 7. The system SHALL capture a date/time stamp and identify the author each time a Record Entry is updated including when opened, when updated, with the signature event and when officially closed, conforming to function <u>TI.2.1.1</u> (Record Entry Audit Triggers). | NC | 21 | 148 |

|-----------------------|---|-----------|---------|-------|
| RI.1.3.2 | Manage Record Entry Amended, | | NC | 04.40 |
| Function | Corrected and Augmented State | | NC | 2149 |

Statement: Manage Record Entries amended, corrected or augmented after finalization (or signature/attestation).

Description: Clinicians need the ability to correct, amend or augment Record Entries once they have been completed. When an amendment, correction or augmentation has been made, principles for documentation practices require that the original documentation must be accessible, readable, and unobliterated. A user must have a clear indication that modifications have been made to an Record Entry. There is optionality in how a system may identify a Record Entry that has been corrected or amended – a flag or indicator could be displayed, the text could be in a different font, etc. The original Record Entry is not required to be displayed, but can be linked or traced back. The original Record Entry and each successive amendment, correction or augmentation should be retained for the legally prescribed timeframe as defined by scope of practice, organizational policy, and/or jurisdictional

| 1. | • | he system SHALL provide the ability to update a Record Entry for purposes of amendment, orrection or augmentation, conforming to function RI.1.1.2 (Amend Record Entry Content). | | | |
|----------------------|---|---|--|----|------|
| 2. | The system SHALL provide the ability to tag a Record Entry as an amendment, a correction of erroneous information and the reason, or an augmentation to supplement content. | | | NC | 2151 |
| 3. | when and by whom | The system SHALL capture, maintain and render the corresponding date, time, and user specifying when and by whom a Record Entry was amended, corrected, or augmented, conforming to function RI.1.1.2.1 (Evidence of Record Entry Amendment Event). | | | 2152 |
| 4. | . The system SHALL present the current version and provide a link or clear direction for accessing previous version(s) of the Record Entry. | | | NC | 2153 |
| 5. | The system SHALL manage all versions of the Record Entry for the legal retention period, conforming to function RI.1.2.1 (Manage Record Entries). | | | NC | 2154 |
| RI.1.3.3 Function | | Manage Record Entry Succession and Version Control | | NC | 2155 |

Statement: Manage successive Record Entry versions over time.

law.

Description: The system must have a mechanism to handle versions and succession of Record Entries (such as a preliminary and final laboratory reports, amended or corrected documents). Versioning and succession management is based on Record Entry content, and/or status change over time.

A version may be one of:1) A completed and attested Record Entry; 2) A Record Entry completed and attested which has been modified one or more times3) A Record Entry that has been viewed for clinical decision-making purposes by an individual other than the author4) A Record Entry that has been captured in an incomplete state per organization business rules and updated over time (i.e., a preliminary laboratory test). 5) A Record Entry that electively, according to the author, must be preserved in the current state at a given point in time (i.e., History and Physical). Certain types of Record Entries are typically handled in versions, for example:

laboratory results (preliminary and final)- Dictated reports- Work ups (over course of days)The prior version of Record Entries should be retained for the legally prescribed timeframe as defined by scope of practice, organizational policy, and jurisdictional law.

| | The system SHOULD provide the ability to manage Record Entries that become new versions when their state changes (e.g., augmented, amended, corrected, etc.). | | | | | 2156 |
|----------------------|---|-----------------|--------------------------------|----|------|------|
| | 2. | The system SHAL | | NC | 2157 | |
| | The system SHALL capture, maintain and render the date, time and user for the original and each updated version of the Record Entry. | | | | NC | 2158 |
| | 4. The system SHALL manage the succession of Record Entries in chronological version order. | | | | NC | 2159 |
| RI.1.3.4 Function | | | Manage Record Entry Retraction | | NC | 2160 |

Statement: Remove a record entry from view if it is deemed erroneous and cite the reason.

Description: Record retraction is used to reverse changes that have been made to existing Record Entries. Once a Record Entry has been retracted, it is no longer visible in standard queries, though it remains accessible in EHR audit records should evidence ever be required for legal or other exceptional circumstances.

Canada Health Infoway provides the following definition for retraction: This mechanism allows an existing record to be "removed" from the EHR if it is deemed erroneous. It can also be used to reverse changes that have been made to an existing record. Once a record has been retracted, it is no longer visible in standard queries, though it remains accessible in EHR audit records should evidence ever be required for legal or other exceptional circumstances. After retracting an erroneous record, a user has the ability to resubmit a corrected record with no visible indication that there was

ever a previous version. Retract generally has significant constraints upon its use because of the risks of removing data from a patient's record that might have been used by others in making decisions. The specifics will vary by jurisdiction, and potentially even by type of data.

There are times that a EHR Record Entry is created then found to be erroneous, i.e., the record may belong to another individual. In these cases, it is necessary to remove that record from view (storing it in case it may be needed for litigation or investigation purposes, etc.). After retracting an erroneous record, a user has the ability to resubmit a corrected record with no visible indication that there was ever a previous version.

| The system SHALL provide the ability to hide a Record Entry from view and retain it such that it is only visible upon specific request and with appropriate authorization. | NC | 2161 |
|--|----|------|
| The system SHOULD provide the ability to capture users who viewed a Record Entry prior to its retraction and notify them of the retraction. | NC | 2162 |

|---|--|--|-----------|---------|------|
| 3 | The system SHOU retracted. | LD provide the ability to capture and retain the reason why a Record Entry was | | NC | 2163 |
| 4. The system SHALL conform to function RI.1.1.17 (Deprecate/Retract Record Entries). | | | NC | 2164 | |
| RI.1.4 Function | | Record Completeness | IN.2.5 | NC | 2165 |

Statement: Manage Record Completeness

Description: The EHR-S must provide the ability for an organization to define minimum elements and timeframes for completion at the report level and at the record level. Provide a report that identifies completion and timeliness status by patient/ health record number or other specified parameters.

Prior to disclosure for legal proceedings or other official purposes, an organization analyzes the health record for completeness. EHR systems must provide the ability to define a minimum set of content to be analyzed for timeliness and completeness and provide a report of the status.

| 1. | The system SHALL provide the ability to manage timeframes for completion of specified Record Entry content according to organizational business rules. | | NC | 2166 |
|------------------|--|--------|----|------|
| 2. | The system SHOULD provide the ability to tag by patient/health record number the completeness status of specified Record Entry content noting identified deficiencies. | | NC | 2167 |
| 3. | The system SHOULD provide the ability to render a report by patient/health record number indicating the completeness status of specified Record Entry content noting identified deficiencies. | | NC | 2168 |
| 4. | The system SHOULD provide the ability to render a visual indicator denoting that the content of a specified Record Entry content is incomplete according to organizational business rules. | | NC | 2169 |
| 5. | The system SHOULD provide the ability to render a reminder to clinicians for the completion of specified Record Entry content (at the data or report level) according to organizational business rules (e.g., complete attestation, complete a section). | | NC | 2170 |
| RI.2 Function | Record Synchronization | IN.2.3 | NC | 2171 |

Statement: Manage Record Synchronization

Description: An EHR-S may consist of a set of components or applications; each application manages a subset of the health information. Therefore it is important that, through various interoperability mechanisms, an EHR-S maintains all the relevant information regarding the health record in synchrony. For example, if a physician orders an MRI, a set of diagnostic images and a radiology report will be created. As a result, the patient demographic information, the order for MRI, the diagnostic images associated with the order, and the report associated with the study must all be synchronized in order for the clinicians to receive a synchronized view the complete record (with respect to time and geographic location). Date and time need to be consistent across the applications that are part of the EHR system.

Synchronization demonstrates a sequence and chain of events for reconstruction and is relevant during a legal proceeding. Maintenance of synchronization activities could be relevant during a legal proceeding.

Note: Standards exist for Consistent Date and Time.

| The system SHALL conform to function <u>TI.5.1</u> (Application and Structured-Document Interchange Standards). | IN.2.3#1 | NC | 2172 |
|--|----------|----|------|
| 2. The system SHOULD conform to function T1.3 (Registry and Directory Services). | IN.2.3#2 | NC | 2173 |
| 3. The system SHOULD provide the ability to link Record Entries to external information. | IN.2.3#3 | NC | 2174 |
| 4. The system SHOULD store the location of each known Record Entry in order to enable authorized access to a complete logical health record if the EHR is distributed among several applications, services, or devices within the EHR-S. | IN.2.3#4 | NC | 2175 |
| The system SHALL provide the ability to manage date and time-related information between applications, components, services, systems, and devices. | | NC | 2176 |

| Section/Id#: Type: | Header/Function Name Conformance Criteria | Reference | Chg Ind | Row# |
|-----------------------|---|-----------|---------|------|
| RI.3 Function | Record Archive and Restore | | NC | 2177 |

Statement: Manage Record Archive and Restore

Description: EHR Record Entries must be transitioned over its lifecycle from online data structures to near-line or off-line data structures. The archive function performs this transition of Record Entries from an online, production EHR-S to offline storage for information that is not being purged/destroyed. The system must provide such archive and restore functions to extract and preserve indefinitely, Record Entries selected to be removed from the live production EHR-S database and retained.

Record Entries must be archived and restored in such a manner as to permit them to be returned to their original or similar information structures. Archived Record Entries must also include corresponding metadata to ensure logical and semantic consistency of the information for subsequent access upon restoration.

The archive function should provide both an automated, configurable capability as well as a user-invoked archival function to enable selected Record Entries to be preserved, or flagged for preservation.

In the first instance, rules are specified to enable the system to conduct archiving in an unattended fashion. This is often the case for periodic system maintenance requirements (e.g., nightly processing where archival, data summarization and possibly purging of information occurs). In the second instance the system should provide the ability to select Record Entries to be preserved for future reference and access, such as in the case where selected Entries need to be preserved and retained for litigation.

In restoring information, it may occur that Record Entries being restored are a subset of the Entries originally archived. For example, when all Record Entries for a patient encounter were archived and only a particular set of Record Entries related to a study or result are to be restored. The system may provide for such finer granularity of restoration.

Archiving and restoring of Record Entries must be performed in a timely fashion, consistent with the operational requirements of both EHR users and system and technology capabilities.

The system must enable compliance with records retention according to scope of practice, organizational policy or jurisdictional law.

| The system SHALL provide the ability to archive and restore Record Entries according to scope of practice, organizational policy, and/or jurisdictional law (e.g., to/from off-line or near-line media). | | NC | 2178 |
|--|--|---|--|
| The system SHALL provide the ability for an authorized user to tag and untag Record Entries to be archived. | | NC | 2179 |
| The system SHALL provide the ability to archive or restore metadata that is associated with Record Entries that have been archived or restored. | | NC | 2180 |
| The system SHOULD provide the ability to enter a target destination when restoring Record Entries (e.g., original data location, temporary user storage, or a research/analysis database). | | NC | 2181 |
| The system SHOULD tag Record Entries in the online database that will be archived or retained during the archival process. | | NC | 2182 |
| The system SHOULD provide the ability to enter a schedule for archive and restore processing. | | NC | 2183 |
| The system MAY provide the ability to selectively restore portions of archived Record Entries. | | NC | 2184 |
| The system SHALL provide the ability to manage (configure) archival parameters for Record Entries (e.g., what and when to archive). | | NC | 0 |
| | The system SHALL provide the ability for an authorized user to tag and untag Record Entries to be archived. The system SHALL provide the ability to archive or restore metadata that is associated with Record Entries that have been archived or restored. The system SHOULD provide the ability to enter a target destination when restoring Record Entries (e.g., original data location, temporary user storage, or a research/analysis database). The system SHOULD tag Record Entries in the online database that will be archived or retained during the archival process. 7. Trust Infrastructure Section

Section Overview

The Trust Infrastructure (TI) Section consists of functions common to an EHR System infrastructure, particularly those functions foundational to system operations, security, efficiency and data integrity assurance, safeguards for privacy and confidentiality, and interoperability with other systems. TI functions are core and foundational to all other functions of the Model (Care Provision, Care Provision Support, Population Health, Administrative Support and Record Infrastructure). Note extensive reference to TI functions in Overarching Criteria. TI functions may be implemented within the architecture of a single system or across a tightly coupled suite of systems (applications). All functions within the Trust Infrastructure Section have an identifier starting with "TI".

|-----------------------|---|-----------|---------|------|
| TI.1.2 Function | Entity Authorization | IN.1.2 | NC | 2199 |

Statement: Manage set(s) of EHR-S access control permissions.

Description: Entities are authorized to use components of an EHR-S in accordance with their scope of practice within local policy or legal jurisdiction. Authorization rules provide a proper framework for establishing access permissions and privileges for the use of an EHR system, based on user, role or context. A combination of these authorization categories may be applied to control access to EHR-S resources (i.e., functions or data), including at the operating system level.

- User based authorization refers to the permissions granted to access EHR-S resources based on the identity of an entity (e.g., user or software component).
- Role based authorization refers to the permissions granted to access EHR-S resources based on the role of an entity. Examples of roles include: an application or device (tele-monitor or robotic); or a nurse, dietician, administrator, legal guardian, and auditor.
- Context-based Authorization refers to the permissions granted to access EHR-S resources within a context, such as when a request occurs, explicit time, location, route of access, quality of authentication, work assignment, patient consents and authorization. See ISO 10181-3 Technical Framework for Access Control Standard. For example, an EHR-S might only allow supervising providers' context authorization to attest to entries proposed by residents under their supervision.

| 1. | an entity (e.g., use | L provide the ability to manage sets of access-control permissions granted to r, application, device) based on identity, role, and/or context according to scope rational policy, and/or jurisdictional law. | IN.1.2#1 | NC | 2200 |
|--------------------|--|--|----------|----|------|
| 2. | The system SHAL events. | L conform to function TI.2 (Audit) to audit authorization actions as security | IN.1.2#2 | NC | 2201 |
| 3. | 3. The system SHALL provide the ability to manage roles (e.g., clinician versus administrator) and contexts (e.g., legal requirements versus emergency situations) for authorization according to scope of practice, organizational policy, and/or jurisdictional law. | | | NC | 2202 |
| 4. | The system SHAL | L maintain a revision history of all entity record modifications. | | NC | 2203 |
| 5. | The system MAY provide the ability to manage authorizations for the use of portable media ir according to scope of practice, organizational policy, and/or jurisdictional law. | | | NC | 2204 |
| TI.1.3 Function | | Entity Access Control | IN.1.3 | NC | 2205 |

Statement: Manage access to EHR-S resources.

Description: To ensure access is controlled, an EHR-S must authenticate and check authorization of entities for appropriate operations.

| | • | | | | |
|----------------------|---------------------------------------|---|----------|----|------|
| 1. | The system SHAL | L conform to function TI.1.1 (Entity Authentication). | IN.1.3#1 | NC | 2206 |
| 2. | The system SHAL | L conform to function TI.1.2 (Entity Authorization). | IN.1.3#2 | NC | 2207 |
| 3. | • | L provide the ability to manage system and data access rules for all EHR-S ng to scope of practice, organizational policy, and/or jurisdictional law. | IN.1.3#3 | NC | 2208 |
| 4. | The system SHAL | L manage the enforcement of authorizations to access EHR-S resources. | IN.1.3#4 | NC | 2209 |
| 5. | by terminating the establishes access | L control access to EHR-S resources after a configurable period of inactivity session, or by initiating a session lock that remains in effect until the entity resusing appropriate identification and authentication procedures, according to cy, and/or jurisdictional law. | | NC | 2210 |
| 6. | • | JLD provide the ability to control-access to data, and/or functionality according e, organizational policy, and/or jurisdictional law. | | NC | 0 |
| 7. | mechanisms that | ALL control-access to data, and/or functionality by using authentication comply with regulatory and policy guidelines (e.g.,by using a combination of ssword, Digital Certificates, Secure Tokens, and/or Biometrics). | | NC | 0 |
| 8. | • | provide the ability to determine the identity of public health agencies for es through the use of internal, and/or external registry services or directories. | | NC | 0 |
| 9. | Meal Delivery ser | provide the ability to determine the identity of healthcare resources (e.g., vices for home-based patients) and devices (e.g., wheelchairs) for resource oses through the use of internal, and/or external registry services or directories. | | NC | 0 |
| TI.1.3.1 Function | | Emergency Access Control | | NC | 2211 |

Statement: Manage emergency access to EHR-S resources.

Description: The intent of Emergency Access Control is to mitigate the potential for impeding the provision of care in an emergency situation in accordance with organizational policy.

For example, emergency access may include: 1) Single record entry (e.g., single laboratory results, single document, single view); 2) Single patient; 3) Single login session, multiple patients; 4) Site mode allowing simultaneous emergency access to all users.

Logging of a user's activities should occur in the audit record/metadata. Reports of emergency access use for follow up are critical for compliance and monitoring.

| 1. The system SHALL provide the ability to define emergency access rules according to scope of practice, organizational policy, and/or jurisdictional law. | NC | 2212 |
|--|----|------|
| The system MAY provide the ability to capture categories of emergency access criteria (e.g., Single record entry such as single laboratory results, single document, single view; 2) Single | NC | 2213 |

| Section/Id#: Type: | | Header/Function Name Conformance Criteria | Reference | Chg Ind | Row# |
|-----------------------|--------------------------------------|--|-----------|---------|------|
| | . , | ogin session, multiple patients; 4) Site mode allowing simultaneous emergency according to scope of practice, organizational policy, and/or jurisdictional law. | | | |
| | | manage emergency access by individual users based on criteria (e.g., defined es) according to organizational policy, and/or jurisdictional law. | | NC | 2214 |
| | • | provide the ability to maintain emergency access time limits according to scope rational policy, and/or jurisdictional law. | | NC | 2215 |
| | ne system MAY p ccess privileges. | resent periodic reminders to a system administrator to review user's emergency | | NC | 2216 |
| 6. Th | ne system SHALI | provide the ability to capture a reason for emergency access. | | NC | 2217 |
| | ne system SHAL | provide the ability to render an after action report for follow up of emergency | | NC | 2218 |
| 1.1.4 unction | | Patient Access Management | IN.1.4 | NC | 2219 |

| | | olicy allows patient access to the EHR-S, THEN the system SHALL conform to ntity Access Control). | IN.1.4#1 | NC | 2220 |
| | | olicy allows patient access to the EHR-S, THEN the system SHALL conform to ntity Authorization). | | NC | 2221 |
| I.1.5 Function | | Non-Repudiation | IN.1.5 | NC | 2222 |

Statement: Limit an EHR-S user's ability to deny (repudiate) data origination, transmission or receipt by that user.

Description: An EHR-S allows data entry to a patient's electronic health record and it can be a sender or receiver of healthcare information. Non-repudiation is a way to guarantee that the source of the data/record cannot later deny that fact; and that the sender of a message cannot later deny having sent the message; and that the recipient cannot deny having received the message. Components of non-repudiation can include:

- Digital signature, which serves as a unique identifier for an individual (much like a written signature);
- Confirmation service, which utilizes a message transfer agent to create a digital receipt (providing confirmation that a message was sent, and/or received);
- Timestamp, which proves that a document existed at a certain date and time;
- The use of standardized timekeeping protocols (e.g., the Integrating the Healthcare Enterprise (IHE) Consistent Time Profile).

| 1. | | capture the identity of the entity taking the action according to scope of practice, cy, and/or jurisdictional law. | IN.1.5#1 | NC | 2223 |
|--------------------|----------------------|---|----------|----|------|
| 2. | | L capture time stamp of the initial entry, modification and exchange of data e of practice, organizational policy, and/or jurisdictional law. | IN.1.5#2 | NC | 2224 |
| 3. | • | L conform to function TI.2 (Audit) to prevent repudiation of data origination, eccipt according to scope of practice, organizational policy, and/or jurisdictional | IN.1.5#3 | NC | 2225 |
| 4. | integrity of data an | JLD conform to function RI.1.1.4 (Attest Record Entry Content) to ensure d data exchange and thus prevent repudiation of data origination, transmission g to scope of practice, organizational policy, and/or jurisdictional law. | IN.1.5#4 | NC | 2226 |
| TI.1.6 Function | | Secure Data Exchange | IN.1.6 | NC | 2227 |

Statement: Secure all modes of EHR data exchange.

Description: Whenever an exchange of EHR information occurs, it requires appropriate security and privacy considerations, including data obfuscation as well as both destination and source authentication when necessary. For example, it may be necessary to encrypt data sent to remote or external destinations.

| 1. | The system SHALL secure all modes of EHR data exchange. | IN.1.6#1 | NC | 2228 |
|----|--|----------|----|------|
| 2. | The system SHALL conform to function TI.1.7 (Secure Data Routing). | IN.1.6#2 | NC | 2229 |
| 3. | The system SHOULD provide the ability to de-identify data. | IN.1.6#3 | NC | 2230 |
| 4. | The system SHALL encrypt and decrypt EHR data that is exchanged over a non-secure link. | IN.1.6#4 | NC | 2231 |
| 5. | IF encryption is used, THEN the system SHALL exchange data using recognized standards-based encryption mechanisms according to organizational policy, and/or jurisdictional law. | IN.1.6#5 | NC | 2232 |
| 6. | IF the EHR-S is the recipient of a secure data exchange, THEN the system SHOULD provide acknowledgment of receipt. | | NC | 2233 |
| 7. | The system SHALL provide the ability to determine static or dynamic addresses for known and authorized sources and destinations. | | NC | 2234 |

Page: 110

| Section/Id#: Type: | Header/Function Name Conformance Criteria | Reference | Chg Ind | Row# |
|-----------------------|---|-----------|---------|------|
| TI.1.7 Function | Secure Data Routing | IN.1.7 | NC | 2235 |

Statement: Route electronically exchanged EHR data only to/from known and authenticated destinations/sources (according to applicable healthcare-specific rules and relevant standards).

Description: An EHR-S needs to ensure that it is exchanging EHR information with the entities (applications, institutions, directories) it expects. This function depends on entity authorization and authentication to be available in the system. For example, a physician practice management application in an EHR-S might send claim attachment information to an external entity. To accomplish this, the application must use a secure routing method, which ensures that both the sender and receiving sides are authorized to engage in the information exchange. Known sources and destinations can be established in a static setup or they can be dynamically determined. Examples of a static setup are recordings of IP addresses or recordings of DNS names. For dynamic determination of known sources and destinations systems can use authentication mechanisms as described in IN.1.For example, the sending of a laboratory order from the EHRS to a laboratory system within the same organization usually uses a simple static setup for routing. In contrast sending a laboratory order to a reference laboratory outside of the organization will involve some kind of authentication process. Provision of a secure network infrastructure is beyond the scope of an EHR-S.

| | $_$ conform to function $$\frac{\text{Tl.1.1}}{\text{Cl.1.1}}$$ (Entity Authentication) to exchange EHR data only , authenticated sources and destinations. | IN.1.7#2 | NC | 2236 |
|--------------------|--|----------|----|------|
| | L conform to function TI.2 (Audit) to capture audit information about changes urces and destinations. | IN.1.7#3 | NC | 2237 |
| TI.1.8 Function | Patient Privacy and Confidentiality | IN.1.9 | NC | 2238 |

Statement: Enable the enforcement of the applicable jurisdictional and organizational patient privacy rules as they apply to various parts of an EHR-S through the implementation of security mechanisms.

Description: Patients' privacy and the confidentiality of EHRs are violated if access to EHRs occurs without authorization. Violations or potential violations can impose tangible economic or social losses on affected patients, as well as less tangible feelings of vulnerability and pain. Fear of potential violations discourages patients from revealing sensitive personal information that may be relevant to diagnostic and treatment services. Rules for the protection of privacy and confidentiality may vary depending upon the vulnerability of patients and the sensitivity of records. Strongest protections should apply to the records of minors and the records of patients with stigmatized conditions. Authorization to access the most sensitive parts of an EHR is most definitive if made by the explicit and specific consent of the patient. Please see the definition of masking in the glossary.

Organizational practices related to privacy and security jurisdictional laws could be called into question during a legal proceeding. Adherence to applicable laws supports the credibility and trustworthiness of the organization.

| The system SHALL provide the ability to maintain compliance with requirements for patient privacy and confidentiality according to scope of practice, organizational policy, and/or jurisdictional law (e.g., US HIPAA Privacy Rules, US Federal Conditions of Participation for Medicare/Medicaid Providers). | IN.1.9#1 | NC | 2239 |
|--|---|--|--|

| 4. | 4. The system SHALL allow emergency access log entry review based on criteria such as individual assignment or specified role, reasons, patient information/record entries according to organizational policy, and/or jurisdictional law. | | | NC | 2549 |
| TI.3 Function | | Registry and Directory Services | IN.3 | NC | 2550 |

Statement: Enable the use of registry services and directories to uniquely identify, locate and supply links for retrieval of information related to: - patients and providers for healthcare purposes; - payers, health plans, sponsors, and employers for administrative and financial purposes; - public health agencies for healthcare purposes, and- healthcare resources and devices for resource management purposes.

Description: Registry and directory service functions are critical to successfully managing the security, interoperability, and the consistency of the health record data across an EHR-S. These services enable the linking of relevant information across multiple information sources within, or external to, an EHR-S for use within an application. This applies to directories/registries internal to the EHR-S as well as directories/registries external to the EHR-S. Transmission may occur automatically or manually and may include small or large amounts of data. Directories and registries support communication between EHR Systems and may be organized hierarchically or in a federated fashion. For example, a patient being treated by a primary care physician for a chronic condition may become ill while out of town. The new provider's EHR-S interrogates a local, regional, or national registry to find the patient's previous records. From the primary care record, a remote EHR-S retrieves relevant information in conformance with applicable patient privacy and confidentiality rules.

An example of local registry usage is an EHR-S application sending a query message to the Hospital Information System to retrieve a patient's demographic data.

| The system SHALL provide the ability to manage internal registry services and directories. | IN.3#1 | NC | 2551 |
|---|--------|----|------|
| The system SHALL provide the ability to exchange information with external registry services and directories. | | NC | 2552 |

| TI.4 Function | Standard Terminology and Terminology Services | IN.4 | NC | 2562 |

Statement: Support semantic interoperability through the use of standard terminologies, standard terminology models and standard terminology services.

Description: The purpose of supporting terminology standards and services is to enable semantic interoperability. Interoperability is demonstrated by the consistency of human and machine interpretation of shared data and reports. It includes the capture and support of consistent data for templates and decision support logic.

Terminology standards pertain to concepts, representations, synonyms, relationships and computable (machine-readable) definitions. Terminology services provide a common way for managing and retrieving these items, including historically correct version interpretation. Terminology services need to support legal requirements for retrospective health record information and system data.

| TI.4.1 | Standard Terminology and Terminology Models | IN.4.1 | NC | 2565 |
|----------|---|----------|------|------|
| Function | Standard Terminology and Terminology Models | 1111.4.1 | l NO | 2303 |

Statement: Employ approved standard terminologies to ensure data correctness and to enable semantic interoperability (both within an enterprise and externally). Support a formal standard terminology model.

Description: Semantic interoperability requires standard terminologies combined with a formal standard information model. An example of an information model is the HL7 Reference Information Model. Another example is the ISO/EN 13606 Electronic Health Record Communication.

A terminology provides semantic and computable identity to its concepts. Examples of terminologies that an EHR-S may support include: LOINC, SNOMED, ICD-9, ICD-10, and CPT-4. Terminologies are use-case dependent and may or may not be realm dependent. The key is that the standard be approved by all stakeholders. For example, terminologies for public health interoperability may differ from those for healthcare quality, administrative reporting, research, etc.

Formal standard terminology models enable common semantic representations by describing relationships that exist between concepts within a terminology or in different terminologies, such as exemplified in the model descriptions contained in the HL7 Common Terminology Services specification.

The clinical use of standard terminologies is greatly enhanced with the ability to perform hierarchical inference searches across coded concepts. Hierarchical Inference enables searches to be conducted across sets of coded concepts stored in an EHR-S. Relationships between concepts in the terminology are used in the search to recognize child concepts of a common parent. For example, there may be a parent concept, "penicillin containing preparations" which has numerous child concepts, each of which represents a preparation containing a specific form of penicillin (Penicillin V, Penicillin G, etc.). Therefore, a search may be conducted to find all patients taking any form of penicillin preparation.

Clinical and other terminologies may be provided through a terminology service internal or external to an EHR-S.

| The system SHALL determine that clinical terms and coded clinical data exist in an approved standard terminology. | | NC | 2564 |
|---|----------|----|------|
| 3. The system SHOULD provide the ability to receive and transmit healthcare data using formal standard information models and approved standard terminologies according to scope of practice, organizational policy, and/or jurisdictional law. | IN.4.1#3 | NC | 2568 |

| 10. | 10. The system SHOULD have the ability to present standard terminology terms in a language which is appropriate for the user. | | | NC | 2575 |
| TI.4.2 Function | | Maintenance and Versioning of Standard Terminologies | IN.4.2 | NC | 2576 |

Statement: Enable version control according to scope of practice, organizational policy, and/or jurisdictional law to ensure maintenance of utilized standard terminologies. This includes the ability to accommodate changes to terminology sets as the source terminology undergoes its natural update process (new codes, retired codes, redirected codes). Such changes need to be cascaded to clinical content embedded in templates, custom formularies, etc., as determined by existing policy.

Description: Version control allows for multiple sets or versions of the same terminology to exist and be distinctly recognized over time. Standard terminologies are usually periodically updated, and concurrent use of different versions may be required. Ideally, the meaning of a concept never changes over time, but a concept can be deprecated, and replaced with a new concept in a new version. However, in some terminologies, the meaning of a concept can change over time. In any case, it is important that retrospective analysis and research maintains the ability to relate to the appropriate conceptual meaning. If the terminology encoding for a concept changes over time, it is also important that for legal health records, as well as for retrospective analysis and research, the different encodings can be correlated to ensure the permanence of the concept as originally captured. This does not necessarily imply that complete older versions of the terminology be kept in the EHR-S, only access to the changes needs to be maintained.

Statement: Map or translate one terminology to another as needed by local, regional, national, or international interoperability requirements.

Description: The ability to map or translate one terminology to another is fundamental to an organization in an environment where several terminologies are in play to meet different purposes. It is a common occurrence that data is captured using one terminology, but is shared using another terminology.

Example: Within a healthcare organization there may be a need to map terminology concepts with the same semantic meaning to meet different purposes (e.g., between an EHRS and an external laboratory system, or between an EHRS and a billing system). Standard terminologies are evolving and maps will need to be adjusted to support this evolution and more sophisticated use of standard terminologies and maps over time.

Realm specific (including local, regional, national or international) interoperability requirements can also determine the need for terminology mapping, and in many cases terminology mapping services (internal or external) can be used to satisfy these requirements.

The interaction and mapping of terminologies may be called into question in a legal proceeding, when clinical decisions were documented or when semantic meaning could be misinterpreted. It is important to seek guidance, document and retain all mapping decisions for all types of terminology mapping, and to recognize when mapping may not be possible from one concept to another. The quality of mapping is dependent upon the skills and interpretation of standard terminologies and clinical information by mapping experts.

| The system SHALL provide the ability to manage data using terminology maps which may be provided by terminology mapping services (internal or external). | IN.4.3#1 | NC | 2587 |

| TI.5 Header | Standards-Based Interoperability | IN.5 | NC | 2592 |

Statement: Provide automated health care delivery processes and seamless exchange of clinical, administrative, and financial information through standards-based solutions.

Description: Interoperability standards enable certain applications to be shared among EHR systems, resulting in a unified (logical) view of a given EHR system where several disparate systems may actually be participating transparently. Interoperability standards also enable certain information to be shared among EHR systems (including information that resides in regional, national, or international information exchanges). Interoperability standards also promote timely and efficient information capture, use, and re-use, often reducing the cumulative workload of the broad set of stakeholders.

When health-related information is exchanged -- or when external applications are used to extend an EHR system -- the interoperability methods and underlying standards that were used in the process may need to be disclosed during a legal proceeding (especially when the resulting information becomes part of the patient's medical record).

| TI.5.1 | Application, Structured-Message, and | NC | 2502 |
|--------|---|----|------|
| Header | Structured-Document Interchange Standards | NC | 2593 |

Statement: Support an EHR system's ability to operate seamlessly with systems that adhere to recognized application interchange standards. These systems include other EHR systems, subcomponents of an EHR system, or other (authorized, non-EHR) systems.

Description: Since a health care organization typically has various external and internal interoperability requirements, it must use a set of corresponding interoperability or interchange standards that will meet its connectivity and information structure, format, and semantic requirements. Information should be exchanged -- and applications should provide functionality -- in a manner that appears to be seamless to the user. To be specific, if data is received from an external source that requires a user to manually copy-and-paste that data into multiple parts of the system, the exchange is not considered to be "seamless".

Examples of standards-based EHR information content and exchange methods include: standards-based data extracts, standards-based messages, standards-based documents (e.g., HL7 Clinical Document Architecture (CDA) documents), standards-based healthcare transactions, and standards-based images (e.g., Digital Imaging and Communication in Medicine (DICOM) documents).

Support for multiple interaction modes is needed to respond to differing levels of immediacy and types of exchange. For example, messaging is effective for many near-real time, asynchronous data exchange scenarios but may not be appropriate if the end-user is requesting an immediate response from a remote application.

A variety of interaction modes are typically supported such as:

- Unsolicited Notifications (e.g., Adam Everyman has arrived at the clinic for his scheduled appointment);
- Query/Response (e.g., Query: Is Adam Everyman known to the system? Response: Yes, Adam's medical record number is 12345678);
- Service Request and Response (e.g., Request: Laboratory Order for "Fasting Blood Sugar". Response: the results of the test);
- Information Interchange between organizations (e.g., in a regional health exchange or in a national health system);
- Structured/discrete clinical documents (e.g., a structured clinical note);
- Unstructured clinical document (e.g., dictated surgical note).

TI.5.1.1

Standard terminology is a fundamental part of interoperability and is described in function <u>TI.4</u>. Using a formal explicit information model further optimizes interoperability. An example of an information model is the HL7 Reference Information Model (RIM). Organizations typically need to deal with more than one information model and may need to develop a mapping between information models, a metamodel (that helps to explain and organize the various information models), or both.

Application Interchange Standards

Statement: Support the management of structured messages.

Description: Structured messages are an important method of facilitating the exchange of information to support care. Messages are often considered to be more transitory in nature; documents are often considered to be more permanent in nature.

| | L provide the ability to manage structured messages according to scope of ional policy, and/or jurisdictional law. | | NC | 0 |
|--------------------|--|--------|----|------|
| TI.5.2 Function | Interchange Standards Versioning and Maintenance | IN.5.2 | NC | 2608 |

Statement: Support various versions of an interchange standard.

Description: Interchange standards characteristically change throughout their lifecycles; those changes are often tagged with "version" numbers. EHR systems need to control the various versions of interchange standards that are used within an EHR implementation and accommodate changes that arise with each version.

For example, if an organization migrates to version 2.5 of HL7's messaging standard, it may choose to utilize that version's specimen or blood bank information capabilities. The organization may also find that certain fields have been retained for backwards compatibility only or withdrawn altogether. The EHR-S needs to be able to handle all of these possibilities.

Standards typically evolve in such a way as to protect backwards compatibility.

On the other hand, sometimes there is little, or no, backwards compatibility when an organization may need to replace an entire standard with a new methodology. An example of this is migrating from HL7 v2 to HL7 v3. Interchange standards that are backward compatible support exchange among senders and receivers who are using different versions. Version control ensures that those sending information in a later version of a standard consider the difference in information content that can be interchanged effectively with receivers, who are capable of processing only earlier versions. That is, senders need to be aware of the information that receivers are unable to capture and adjust their business processes accordingly.

Version control enables multiple versions of the same interchange standard to exist and be distinctly recognized over time. Since interchange standards are usually periodically updated, concurrent use of different versions may be required.

Large (and/or federated) organizations typically need to use different versions of an interchange standard to meet internal organizational interoperability requirements.

For example, the enterprise-wide standard might use HL7 v2.5 for laboratory messages, but some regions of the enterprise might be at a lower level.

It should be possible to retire deprecated interchange standards versions when applicable business cycles are completed while maintaining obsolete versions. An example use of this is for possible claims adjustment throughout the claim's life cycle.

When interchange standards change over time, it is important that retrospective analysis and research correlate and note gaps between the different versions' information structures to support the permanence of concepts over time.

| 1 | The system SHALL provide the ability to use different versions of interchange standards. | IN.5.2#1 | NC | 2609 |
|---|---|----------|----|------|
| 2 | The system SHALL provide the ability to change (reconfigure) the way that data is transmitted as an interchange standard evolves over time and in accordance with business needs. | IN.5.2#2 | NC | 2610 |
| 3 | The system SHOULD provide the ability to deprecate an interchange standard. | IN.5.2#3 | NC | 2611 |
| 4 | The system SHOULD provide the ability to integrate with other systems that use previously- supported versions of an interoperability standard according to scope of practice, organizational policy, and/or jurisdictional law. | IN.5.2#4 | NC | 2612 |

|-----------------------|---|-----------|---------|------|
| TI.5.3 Function | Standards-Based Application Integration | IN.5.3 | NC | 2613 |

Statement: Integrate applications in a standards-based manner.

Description: An EHR-S often consists of multiple applications. Some of those applications may be within the EHR-S; others may be external to the EHR-S. The user of the EHR-S often benefits when those applications are integrated. Application integration can be accomplished in an ad-hoc fashion or in a standards- based fashion.

The method(s) by which applications may be integrated within an organization depends on that organization's approach to application integration. A given organization could conceivably employ multiple application integration approaches to meet various application integration requirements.

| 1. | | provide the ability to integrate applications in a standards-based fashion when cosed of, and/or is extended by disparate applications. | IN.5.3#1 | NC | 2614 |
|--------------------|--------------------|---|----------|----|------|
| 2 | purposes applicati | ULD provide the ability to integrate user (or system) authentication for the on context management (e.g., Graphical User Interface application integration Management Standard from the Clinical Context Object Work Group (CCOW)). | | NC | 2615 |
| TI.5.4 Function | | Interchange Agreements | IN.5.4 | NC | 2616 |

Statement: Support the use of Interchange Agreements to specify the rules, responsibilities, expectations, and methods by which Interchange Agreement partners may exchange information.

Description: Systems that wish to communicate with each other must agree on certain parameters/criteria that will govern an information exchange process. Interchange agreements enable partnering systems to discover, negotiate, and utilize those parameters/criteria. An EHR-S can use this information to define how data will be exchanged between the sending and the receiving partners. Interchange services and capabilities can be discovered in an automated fashion.

Entity directories can be used to determine the address, profile, and data exchange requirements of known, and/or potential Interchange Agreement partners. Entity registries can be used to determine the security, addressing, and reliability requirements between potential Interchange Agreement partnering systems.

| 1. | | LL exchange information with Interchange Agreement partners based on reement descriptions. | IN.5.4#1 | NC | 2617 |
|--------------------|-----------------|--|----------|----|------|
| 2. | system SHOULD e | agreement description specifies the use of a certain standard, THEN the exchange information using the standard specified by the interchange agreement ing to scope of practice, organizational policy, and/or jurisdictional law. | IN.5.4#2 | NC | 2618 |
| 3. | | conform to function TI.3 (Registry and Directory Services) to interact with directories to determine the address, profile, and data exchange requirements otential partners. | IN.5.4#3 | NC | 2619 |
| 4. | | nalyze and present interchange service descriptions and capabilities according e, organizational policy, and/or jurisdictional law. | IN.5.4#4 | NC | 2620 |
| 5. | | JLD provide the ability to manage Interchange Agreements that have been terchange Agreement partners. | | NC | 2621 |
| TI.5.5 Function | | System Integration | | NC | 2622 |

Statement: Support the integration of the EHR system with related systems.

Description: Within a given organization (for example, an institution, facility, or integrated care-delivery network), an EHR system may be directly integrated with other systems (for example, a laboratory Information System, Radiology System, Pharmacy System, or Hospital Information System). Conversely, an EHR system may access these other systems indirectly by integrating with a system that serves as the central routing mechanism for the organization. For example, the EHR system may be integrated with the Hospital Information System which then routes the EHR system's orders to a laboratory, pharmacy, or radiology service.

Depending on the type of information that is exchanged within an integrated-system environment, certain heuristics may be needed that will help govern the information exchange process.

| The system SHALL provide the ability to integrate the EHR system with other systems (a laboratory Information System, Radiology System, Pharmacy System, or Hospital Information System) according to scope of practice, organizational policy, and/or jurisdictional law. | | 2623 |
|--|----------|------|
| 2. The system SHOULD provide the ability to exchange discrete information (e.g., problem medication, and/or allergy information) with an integrated system data repository. | list, NC | 2624 |
| The system SHOULD provide the ability to exchange clinical documents with an integrated sys Clinical Document Repository. | tem NC | 2625 |
| 4. The system MAY exchange information with systems that are integrated with the EHR sysusing heuristics that are defined by, and according to scope of practice, organizational policy, or jurisdictional law. | | 2626 |

| Section/Id#: Type: | Header/Function Name Conformance Criteria | Reference | Chg Ind | Row# |
|-----------------------|---|-----------|---------|------|
| TI.6 Function | Business Rules Management | IN.6 | NC | 2627 |

Statement: Manage the ability to create, update, delete, view, and version business rules including institutional preferences. Apply business rules from necessary points within an EHR-S to control system behavior. An EHR-S audits changes made to business rules, as well as compliance to and overrides of applied business rules.

Description: EHR-S business rule implementation functions include decision support, diagnostic support, workflow control, and access privileges, as well as system and user defaults and preferences. An EHR-S supports the ability of providers and institutions to customize decision support components such as triggers, rules, or algorithms, as well as the wording of alerts and advice to meet realm specific requirements and preferences.

| 1. | The system SHAL | L provide the ability to manage business rules. | IN.6#1 | NC | 2628 |
|------------------|-------------------------|--|---------|----|------|
| | | JLD provide the ability to enter, import, or receive business rules to guide system | IN.6#2 | NC | 2629 |
| 3. | The system SHOL | JLD provide the ability to maintain business rules and their components. | IN.6#3 | NC | 2630 |
| 4. | • | JLD provide the ability to tag decision support rules as inactive / obsolete or to ording to scope of practice, organizational policy, and/or jurisdictional law. | IN.6#5 | NC | 2631 |
| 5. | The system SHOL | JLD support the ability to render business rules. | IN.6#23 | NC | 2632 |
| 6. | | JLD provide the ability to manage diagnostic decision support rules that guide ccording to scope of practice, organizational policy, and/or jurisdictional law. | IN.6#7 | NC | 2633 |
| 7. | | ULD provide the ability to manage workflow control rules that guide system g to scope of practice, organizational policy, and/or jurisdictional law. | IN.6#12 | NC | 2634 |
| 8. | • | ULD provide the ability to manage access privilege rules that guide system g to scope of practice, organizational policy, and/or jurisdictional law. | IN.6#17 | NC | 2635 |
| 9. | defaults rules and | ILD provide the ability to manage other rules (for example, monitoring rules, user preferences rule) that guide system behavior according to scope of practice, cy, and/or jurisdictional law. | | NC | 2636 |
| 10. | The system SHALI rules. | L provide the ability to determine system behavior based upon defined business | | NC | 2637 |
| TI.7 Function | | Workflow Management | IN.7 | NC | 2638 |

Statement: Support workflow management functions including both the management and set up of work queues, personnel lists, and system interfaces as well as the implementation functions that use workflow-related business rules to direct the flow of work assignments.

Description: Workflow management functions that an EHR-S supports include:

- -Distribution of information to and from internal and external parties;
- -Support for task-management as well as parallel and serial task distribution;
- -Support for notification and task routing based on system triggers; and-Support for task assignments, escalations and redirection in accordance with business rules.

Workflow definitions and management may be implemented by a designated application or distributed across an EHR-S.

| The system SHALL provide the ability to manage workflow business rules including work queues, personnel lists, and system interfaces. | IN.7#3 | NC | 2639 |
|---|---------|----|------|
| The system SHOULD provide the ability to determine workflow assignments based on workflow- related business rules. | IN.7#1 | NC | 2640 |
| 3. The system MAY provide the ability to manage human resources (i.e., personnel lists) for workflow queues. | IN.7#4 | NC | 2641 |
| 4. The system MAY exchange information with external systems (for example, Human Resources system or Staff Management system) to support the management of human resources. | IN.7#5 | NC | 2642 |
| The system MAY exchange information with external systems (for example, Human Resources system or Staff Management system) to support the management of workflow queues (task lists). | IN.7#6 | NC | 2643 |
| 6. The system MAY provide the ability to exchange workflow related information with an external system. | IN.7#7 | NC | 2644 |
| 7. The system MAY provide the ability to render notifications and tasks based on system triggers. | IN.7#8 | NC | 2645 |
| 8. The system MAY determine and render an updated priority of tasks on the workflow (task list) queue in accordance with business rules, and according to scope of practice, organizational policy, and/or jurisdictional law. | IN.7#9 | NC | 2646 |
| 9. The system MAY determine and render an update to the tasks, and/or execution path on the workflow (task list) queue in accordance with business rules, and according to scope of practice, organizational policy, and/or jurisdictional law. | IN.7#10 | NC | 2647 |
| 10. The system MAY determine and render an update to the assignment of the resources to workflow (task list) queue in accordance with business rules, and according to scope of practice, organizational policy, and/or jurisdictional law. | IN.7#11 | NC | 2648 |
| 11. The system SHOULD provide the ability to render a notification of a workflow update. | | NC | 2649 |
| 12. The system MAY provide the ability to render a notification of a workflow update including the details of the update. | | NC | 2650 |

| Section/Id#: Type: | Header/Function Name Conformance Criteria | Reference | Chg Ind | Row# |
|-----------------------|--|-----------|---------|------|
| 13. | The system SHOULD provide the ability to transmit a workflow (task list) queue update request to an external system. | | NC | 2651 |
| 14. | The system SHOULD provide the ability to receive a workflow (task list) queue update response from an external system. | | NC | 2652 |
| TI.8 Function | Database Backup and Recovery | | NC | 2653 |

Statement: Provide for the ability to backup and recover the EHR system.

Description: To enable the preservation of the EHR database and it's data, functionality needs to be present to record a copy of the database and it's contents to offline media as well as the recovery of the system from a backup copy and resumption of normal system operation. The backup must preserve both data as well as database structure and definition information sufficient to recover a complete functional EHR system. Database components may include, but not be limited to application data, security credentials, log/audit files, and programs; ultimately all EHR components necessary to provide a full and complete operating environment. Finally, the backup must be capable of being used during recovery processing to restore an exact copy of the EHR system as of a particular instant in time. This is a requirement to be able to preserve logical consistency of information within the recovered EHR system.

In providing for this capability the system may Include multiple backup, and/or redundancy solutions such as fail-over architecture, database journaling, transaction processing, etc.

The backup and recovery function must address both physical system failure (i.e. failure of EHR system hardware) as well as logical system failure (e.g., database corruption). To support the requirement that the EHR system be available whenever it is needed within the design parameters of the system and provide reliability and redundancy of the EHR database and it's data, the backup function shall not impact user functionality or appreciably impact user performance.

The backup function may include features which permit multiple processes and technologies to perform it's task. This may include multiple backup technologies such as tape, disk, cloud, etc. Also, multiple architectures such as redundancy, online, near-line and off-line media.

| | • | ALL provide the ability to backup and recover EHR information according to scope anizational policy, and/or jurisdictional law. | NC | 2654 |
|------------------|---------------------------------------|---|----|------|
| | • | HALL provide the ability to backup and recover all database contents including all software components necessary to permit a complete EHR to be recovered. (i.e., d recovery) | NC | 2655 |
| | • | AY provide the ability to backup and recover EHR information using alternative is in addition to a full backup/recovery (e.g., incremental, differential, reverse delta, | NC | 2656 |
| | 4. The system Ma | AY provide the ability to backup EHR information according to a defined schedule ia rotation. | NC | 2657 |
| | the system SH | er requirements specify that the EHR system be available continuously, THEN ALL provide the ability to backup EHR information concurrently with the normal EHR application. | NC | 2658 |
| | 6. The system SH | OULD provide the ability to backup EHR information to a remote location. | NC | 2659 |
| | 7. The system Ma (e.g., disk, tape | AY provide the ability to backup EHR information to more than one storage media e, or cloud). | NC | 2660 |
| | 8. The system MA | AY provide the ability to encrypt backup data. | NC | 2661 |
| TI.9 Function | | System Management Operations and Performance | NC | 2662 |
| | | | | |

Statement: Manage the change of status of an external facility and the ability to access, render and determine information related to Service Level Agreement.

Description: A health care delivery relies on services provided by other external facilities such as laboratories or Long Term Care facilities. The status of those facilities is subject to change for example: power outage, flooding or overcapacity. Therefore, the EHR system needs to capture the status of the external facilities, notify appropriate individuals / organizations or even change the workflow based on established business rules. Change of the status of an external facility is patient safety concern because a provider may need to adjust patient care or care workflows accordingly. For example, changes of status of external facility include: laboratory no longer accredited, laboratory power outage, Long Term Care facility at overcapacity. If laboratory loses accreditation an administrator needs to be notified to adjust the workflow. If status change is anticipated on regular basis, the system may automatically trigger workflow adjustment according to established business rules that take into consideration the status of the external facility. The example for later, the local Long Term Care facility may routinely exceed the capacity on the weekends; therefore, the business rule will accommodate for automatic workflow adjustments. A provider may need to be aware of certain Service Level Agreement information in order to mitigate patient safety-related risks that depend on system availability or system performance.

| The system SHOULD provide the ability to manage the change of status of an external facility. | NC | 2663 |
|--|----|------|
| 2. The system SHOULD provide the ability to manage Service Level Agreement information according to scope of practice, organizational policy, and/or jurisdictional law. | NC | 2664 |
| 3. The system MAY provide the ability to render system availability statistics and system performance statistics as specified in the Service Level Agreement according to scope of practice, organizational policy, and/or jurisdictional law. | NC | 2665 |
